Function

The devices each have a logic input that is isolated from the power supply. The field devices are controlled by means of these logic inputs.

Voltage signals in a range of 16 V DC ... 30 V DC are accepted as 1-signals. The 0-signal must be within a range of DC 0 V... 5 V. The current consumption of the logic inputs is about 3 mA each.

The outputs have the characteristics of a voltage supply with 24 V and 270 Ω. The output current is limited to 45 mA.

Application

• Control/supply of intrinsically safe valves, audible alarms, indicators etc.
• Control/supply of semiconductors (e. g. LED or LCD units)

In case of controlling semiconductors, a parallel resistor of approx. 10 kΩ, directly connected at the load, may be necessary, if the lead breakage monitoring is activated.

Notes

Lead monitoring (only KFD2-SL2-Ex2)
A fault signal is activated across the Power Rail (UPR-03) in the case of an error (lead breakage > 15 kΩ or lead short circuit < 50 Ω). The power feed module evaluates and passes on the fault signal by means of a potentially free contact.

Accessories

Power Rail PR-03
Power Rail UPR-03
Power feed module KFD2-EB2...

Using Power Rail PR-03 or UPR-03 the devices are supplied with 24 V DC by means of the power feed modules. If no Power Rails are used, power supply of the individual devices is possible directly via their device terminals.

Each power feed module is used for fusing and monitoring groups with up to 100 individual devices. The Power Rail PR-03 is an inset component for the DIN rail. The Power Rail UPR-03 is a complete unit consisting of the electrical inset and an aluminium profile rail 35 mm x 15 mm x 2000 mm. To make electrical contact, the devices are simply engaged.

The Power Rail must not be fed via the device terminals of the individual devices!
