

Measuring automation light grid with beam spacing of 17 mm, IO-Link interface, push-pull output, fixed cable with M12 plug

Function

Automation light grids in the LGM Series are designed to measure small to large objects. The slimline light grids are modular in design and are available with various beam gaps and field heights. The entire signal evaluation process is carried out within the device. The lightweight systems can be integrated elegantly into their surroundings, from both a technical and a visual perspective. As a result, machines and plants operating in temperature ranges between -30 °C ... +60 °C can be designed to more compact dimensions.

Application

- · Detection of objects over large areas
- · Detecting and counting irregular objects
- · Measuring and sorting objects of different heights (height checking)
- · Presence and overhang control in material handling systems
- Web sag monitoring
- · Position or shape monitoring (object identification)

Characteristic Curve

System Description

The light grid consists of a emitter and a receiver, between which is the area to be monitored.

The switching command and measurement of the object is triggered when an object enters or is already present in the monitoring field. The modular system design supports a wide range of distances for the lines of light. Optimum implementation of the light grids for specific application requirements is thus possible.

The system is programmed using the integrated touch field or the IO-Link interface.

Output of the analog measured value is included in the IO-Link protocol. Users can choose from a vast selection of integrated measurement protocols.

The most important measurement protocols are:

- Lowest position of the object
- Highest position of the object
- · Height of the object
- · Height of the object as the total height of all partial objects
- Height of the largest partial object
- · Mid-position of the largest partial object
- Lowest position of the largest partial object
- Highest position of the largest partial object
- ...

Parameterization

IO-Link

The sensor parameters are device-specific and are described in the standardized IO Device Description file (IODD). The IODD can be read into different engineering tools using IODD support from different system providers. The sensor can then be configured or diagnosed using the relevant tool and a user interface generated from the IODD. The IODD interpreter are available in the corresponding product description on our homepage, www.pepperl-fuchs.com. For the IODD description contact the Pepperl+Fuchs support.

Design and Function

Safety information

The device must be operated only at low protective voltage where there is safe electrical isolation. Modifications and repairs must be carried out only by your supplier!

The system must be maintained and inspected on a regular basis.

A soft, clean cloth may be used to clean the system. Do not use any aggressive or abrasive cleaning agents that will corrode the surfaces. The device must not be subjected to severe impacts or vibrations.

Commissioning

Prerequisites

- The transmitter unit and receiver unit have been mounted and aligned correctly.
- The electrical connection has been established as per the information in the connection diagram.
- The signal output responds to object measurement.
- If at least one beam of light is interrupted, the output remains active for as long as the object is detected.

Troubleshooting

Singapore: +65 6779 9091 fa-info@sg.pepperl-fuchs.com

Refer to "General Notes Relating to Pepperl+Fuchs Product Information"

- Measure operating voltage
- Check cabling.
- Check transmitter and receiver unit for dirt. Clean if necessary.

Function indicators

A green LED for indicating the operating status "Power ON" and a yellow status indication LED are fitted on the connection side of the profiles, behind the lens cover.

Transmitter Unit

Function	Description of Diagnosis
Green LED to display operating status permanently illuminated	Power On
Green LED to display operating status is not illuminated. Yellow LED to indicate status is flashing	Energy-saving mode
Yellow LED to indicate status is not illuminated	Transmission power of transmitter is low
Yellow LED to indicate status is permanently illuminated	Transmission power of transmitter is high
Yellow LED to indicate status is flashing rapidly (approx. 8 Hz)	Fault state
Yellow LED to indicate status — brief change in light emitted	Test input is activated

Receiver Unit

Function	Description of Diagnosis	
Green LED to display operating status permanently illuminated	Power On	
Green LED to display operating status is not illuminated	Energy-saving mode	
Green LED to display operating status is flashing at brief intervals	IO-Link mode active. Possible to parameterize the device only via IO-Link	
Green LED to display operating status is flashing (4 Hz)	Fault status: short circuit at the outputs	
Yellow LED to indicate status is permanently illuminated	Detection field interrupted	
Yellow LED to indicate status is not illuminated	Detection field is clear.	
Yellow LED to indicate status is flashing (approx. 4 Hz)	Insufficient stability control	
Yellow LED to indicate status is flashing rapidly (approx. 8 Hz)	Fault state: fault during signal measurement	

Resolution and Beam Gap

The optical resolution of the light grid corresponds to the size of the object that can be detected.

The values specified in the technical data under "Optical Resolution" apply if signal tracking for the threshold value is activated. Where the system is parameterized via the touch field menu (level 2, "Signal Tracking"), the value is automatically set to 60 %. It is not possible to set other values. To parameterize the system via IO-Link, a threshold value of at least 60 % must be entered. Signal tracking for the threshold value is deactivated by default, increasing the optical resolution by a maximum of 4 mm. By selecting 3-way crossover of the light beams, the resolution of the light grid is refined.

The switching outputs respond to any instance in which the beam is interrupted by an object. Selective object detection can also be parameterized using predefined or taught-in objects. Up to 2 beam areas can be suppressed (blanking).

The devices are supplied without object detection programmed, with signal tracking of the threshold value deactivated, and with a beam path with a 3-way crossover.

Resolution of the Crossed Beam Arrangement

If 3-way beam crossover is programmed, the resolution is refined. In the case of 3-way crossover, this means that the increased resolution is offered once 25 % of the transmitter unit range or receiver unit range has been covered. It is therefore necessary to ensure that all objects pass the transmitter or receiver with such a gap.
