Results of the IEC 61508 Functional Safety Assessment

Project:
KFD0-RSH-1.4S.PS2

Customer:
Pepperl+Fuchs GmbH
Mannheim
Germany

Contract No.: P+F 0905-35R1-C
Report No.: 1003-97R1-C R017
Version 1, Revision 2, May 2011

Audun Opem, Peter Söderblom

Management summary

The Functional Safety Assessment of the Pepperl+Fuchs GmbH, performed by *exida* Certification S.A. consisted of the following activities:

- *exida* Certification S.A. assessed the setup of the development process used by Pepperl+Fuchs GmbH for development projects against the relevant requirements of IEC 61508 parts 1 and 2.

Subject to this assessment were the Functional Safety Planning activities, the tailoring of the Verification and Validation activities and the realization of the technical safety aspects using the KFD0-RSH-1.4S.PS2 development project.

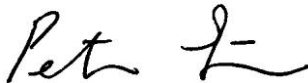

- *exida* Certification S.A. audited the development process by a detailed development audit which investigated the compliance with IEC 61508 of the processes, procedures and techniques as implemented for the Pepperl+Fuchs GmbH KFD0-RSH-1.4S.PS2 development. The investigation was executed using subsets of the IEC 61508 requirements tailored to the work scope of the development team.
- *exida* Certification S.A. assessed the Safety Case prepared by Pepperl+Fuchs GmbH against the technical requirements of IEC 61508.

The result of the Functional Safety Assessment can be summarized by the following statements:

The audited development process as tailored and implemented by the Pepperl+Fuchs GmbH Type A KFD0-RSH-1.4S.PS2 development project, complies with the relevant safety management requirements of IEC 61508 SIL 3.

The assessment of the FMEDA, which was performed according to IEC 61508, has shown that the KFD0-RSH-1.4S.PS2 has a PFD_{AVG} within the allowed range for SIL 3 (HFT = 0) according to table 2 of IEC 61508-1 and a Safe Failure Fraction (SFF) of > 95%.

This means that the KFD0-RSH-1.4S.PS2 with Hardware version 05-6166 is capable for use in SIL 3 applications in low or high demand mode, when properly designed into a Safety Instrumented Function per the requirements in the Safety Manual.

1 Purpose and Scope

This document describes the results of the

Full Functional Safety Assessment according to IEC 61508

of the product development processes according to the safety lifecycle phase 9 of IEC 61508-1. The purpose of the assessment was to investigate the compliance of:

- the KFD0-RSH-1.4S.PS2 with the technical IEC 61508-2 requirements for SIL 3 and the derived product safety property requirements

and

- the KFD0-RSH-1.4S.PS2 development processes, procedures and techniques as implemented for the safety-related deliveries with the managerial IEC 61508-1 and -2 requirements for SIL 3.

It was not the purpose to assess the fulfillment of the statement of conformance from Pepperl+Fuchs GmbH for the following European Directives;

- EMC Directive
- Pressure Directive
- Low Voltage Directive
- ATEX Directive

The correct execution of all activities that lead to the statement of Conformance to these European Directives is in the responsibility of Pepperl+Fuchs GmbH and builds a basis for the certification.

It was not the purpose of the assessment / audits to investigate Company quality management system versus ISO 9001 and ISO 9000-3 respectively.

The assessment has been carried out based on the quality procedures and scope definitions of *exida* Certification S.A.

1.1 Tools and Methods used for the assessment.

This assessment was carried by using the *exida* Certification assessment documents, templates and checklists which are derived from the Safety Case DB tool. The expectations for a positive judgment of the assessor are documented within this tool.

The assessment was based on a set of document templates, e.g. for the document review & assessment comments and the assessment plan.

2 Project Description

2.1 Description of the Functional Safety Management System

The functional safety management system is implemented by the use of the functional safety management plan contained in the V&V plan [D1], the P+F Development process [D2] and the related planning documents, which describes the activities in detail. The V&V plan shows the implementation of a safety life cycle model which adopts the V-model as described in IEC 61508.

The related planning documents are mainly the configuration management plan, the test plan and a set of templates and guidelines.

Evidence for the fulfilment of the detailed requirements have been collected in a FSM Justification report section in the V&V plan[D1], which was subject to the assessment.

2.2 Description of the System

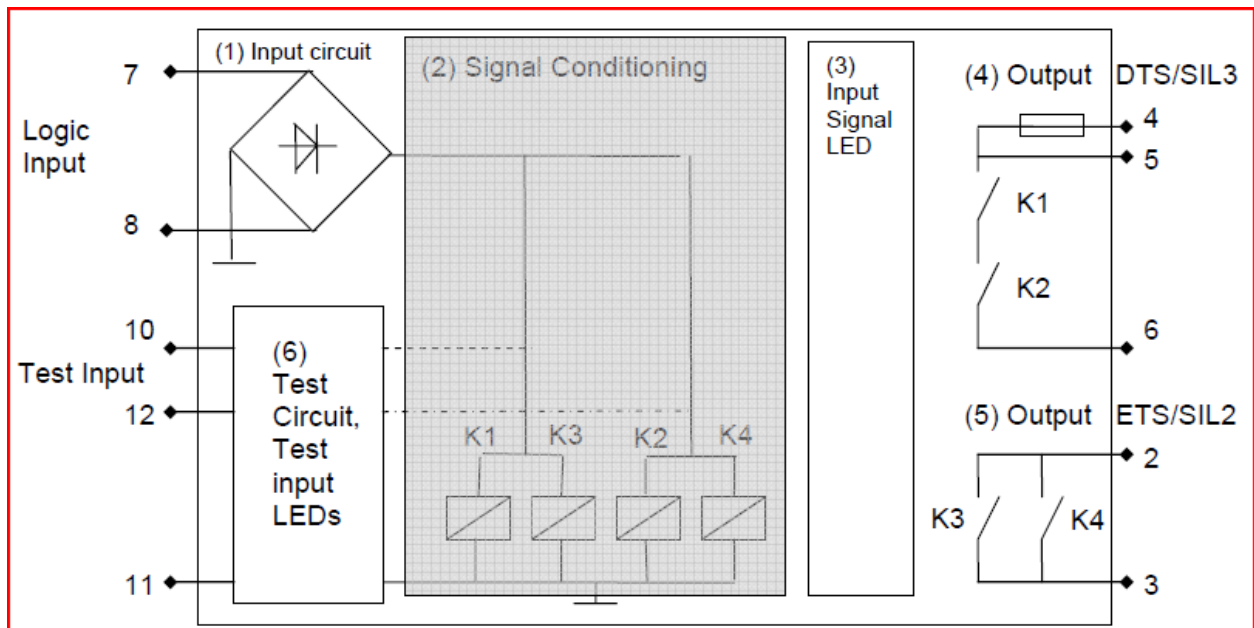

The KFD0-RSH-1.4S.PS2 is a loop powered relay module with a logic input and two different relay outputs implementing two safety functions.

- One output with two relays in series (Output DTS) where terminal 6 and 4 or 5 is used. If terminal 5 is used, it is recommended to use an external fuse as protection against over current. This has a SIL 3 capability.
- One output with two relays in parallel (Output ETS) where terminal 2 and 3 is used. This output has a SIL 3 capability.

With both outputs in combination, a non safety application for dual pole switching (DPS) is possible (e.g. output load between terminal 6 and 2, supply between terminal 5 and 3). Additionally a test input for proof tests is available.

This project is a minor modification of the HW circuitry for the PS1 in order to increase the SFF above 90% for the ETS output. No change in the basic concept was necessary.

For organizational reasons, the project is made as a complete new product in terms of documentation, but the actual work is an update of the KFD0-RSH-1.4S.PS1

3 Project management

3.1 Assessment of the development process

The development audit was closely driven by subsets of the IEC 61508 requirements. That means that the Functional Safety Management related requirements were grouped together according to their related objectives. The detailed answers to the requirements, i.e. the justification reports, (Design description [D4] - technical requirements and V&V Plan [D1] – process requirements) were subject to the assessment. This assessment of the justification reports was supplemented by the prior review of documents.

The assessment was planned by *exida* Certification S.A. [R3] and agreed with Pepperl+Fuchs GmbH.

The following IEC 61508 objectives were subject to detailed auditing at Pepperl+Fuchs GmbH:

- FSM planning, including
 - Safety Life Cycle definition
 - Scope of the FSM activities
 - Documentation
 - Activities and Responsibilities (Training and competence)
 - Configuration management
- Safety Requirement Specification
- Change and modification management
- Hardware architecture design - process, techniques and documentation
- Hardware design / probabilistic

- Hardware and system related V&V activities including documentation, verification
 - Integration and fault insertion test strategy
- System Validation
- Hardware-related operation, installation and maintenance requirements

The project teams, not individuals were audited.

The development audit of the KFD0-RSH-1.4S.PS1 project was performed in Mannheim 26.01.2010. The assessment of the PS2 was done offline and in a phone conference / Webex meeting 09.06.2010.

3.2 Roles of the parties involved

Pepperl+Fuchs GmbH

Represents the designer of the safety related KFD0-RSH-1.4S.PS2 and the investigated organization. The following teams / responsible persons were audited:

- Project Management
- System Architect
- Safety Manager
- Safety Coordinator
- Safety Coordinator

exida Certification S.A.

Set up and structure of the assessment and audit process, extracted the requirements for the assessment and audit from the IEC 61508 standard and guided through the audit.

The activities were done by exida Certification S.A. as an independent organization. The assessment was performed by Audun Opem and Peter Söderblom which were not involved in the execution of the audited activities.

4 Results of the Functional Safety Assessment

exida Certification S.A. assessed the development process used by Pepperl+Fuchs GmbH for this development project against the objectives of IEC 61508 parts 1 and 2. The results of the pre-assessment are documented in [R1].

All objectives have been successfully considered in the Pepperl+Fuchs GmbH development processes for the KFD0-RSH-1.4S.PS2 development.

exida Certification S.A. assessed the safety case prepared by Pepperl+Fuchs GmbH, including a set of documents, against the functional safety management requirements of IEC 61508. This was done by a pre-review of the completeness of the related requirements and then a spot inspection of certain requirements, before the development audit.

The safety case demonstrated the fulfillment of the functional safety management requirements of IEC 61508-1 and 2.

The detailed development audit (see [R2]) investigated the compliance with IEC 61508 of the processes, procedures and techniques as implemented for the Pepperl+Fuchs GmbH KFD0-RSH-1.4S.PS2.

The investigation was executed using subsets of the IEC 61508 requirements tailored to the work scope of the development team.

The result of the assessment shows that the KFD0-RSH-1.4S.PS2 with Hardware version 05-6166 is capable for use in SIL 3 applications, when properly designed into a Safety Instrumented Function per the requirements in the Safety Manual.

Some areas of improvement were nevertheless identified. The recommended improvements given are generally required to formally show the compliance to IEC 61508. However, Pepperl+Fuchs GmbH was able to demonstrate with respect to the size of the project (limited number of people) and the specific complexity of the product that the objectives of the related areas have been successfully met. More details can be found in the chapter below.

4.1 Technical aspects of the KFD0-RSH-1.4S.PS2

The device KFD0-RSH-1.4S.PS2 can be used as interface in I/O loops for ESD (Emergency Shut Down) systems classified as SIL 3. Their safe state is De-energized To (Safe) trip, i.e. the relays are opened and the output is not conducting, (DTS). Or the device can be used as interface in I/O loops for Fire and Gas systems classified as SIL 3. Their safe state is Energized To activate (Safe), i.e. the relays are closed and the output is conducting (ETS).

This is a single channel Type A (HFT=0) system with low complexity and with partial redundancies (relays). The two relays in both safety functions are diverse. The relays are rated for up to 8A contact load but the device is limited to a maximum of 5A contact load, 4A recommended. A common cause factor of 10% is used for the redundant parts (relays). Either the internal or an external fuse should be used to avoid welding of contacts.

No diagnostics are implemented.

4.2 Functional Safety Management.

Objectives of the Functional Safety Management

The main objectives of the related IEC 61508 requirements are to:

- Structure, in a systematic manner, the phases in the overall safety lifecycle that shall be considered in order to achieve the required functional safety of the E/E/PE safety-related systems.
- Structure, in a systematic manner, the phases in the E/E/PES safety lifecycle that shall be considered in order to achieve the required functional safety of the E/E/PE safety-related systems.
- Specify the management and technical activities during the overall, E/E/PES and software safety lifecycle phases which are necessary for the achievement of the required functional safety of the E/E/PE safety-related systems.
- Specify the responsibilities of the persons, departments and organizations responsible for each overall, E/E/PES and software safety lifecycle phase or for activities within each phase.
- Specify the necessary information to be documented in order that the management of functional safety, verification and the functional safety assessment activities can be effectively performed.
- Document all information relevant to the functional safety of the E/E/PE safety-related systems throughout the E/E/PES safety lifecycle.
- Document key information relevant to the functional safety of the E/E/PE safety-related systems throughout the overall safety lifecycle.
- Select a suitable set of tools, for the required safety integrity level, over the whole safety lifecycle which assists verification, validation, assessment and modification.

4.2.1 Safety Life Cycle

The development process as described in the V&V plan [D1] and in the P+F Development process [D2] is structured such that all relevant phases of the overall Safety Life Cycle are identified and that different phases are defined with the necessary activities, inputs and outputs.

Conclusion: The objectives of the standard are fulfilled by the Pepperl+Fuchs GmbH functional safety management system.

4.2.2 FSM planning

The V&V plan [D1] and the P+F Development process [D2] defines the different development phases together with the corresponding input and output documents, related templates and guidelines. All major activities related to specification, design, implementation, verification and validation are defined and planned in these process documents.

The different roles and responsibilities of the project members are defined. Furthermore the V&V plan [D1] is also used for tracking of the safety activities in the project.

The modification procedures for both the development project and after product release are also described in the V&V plan [D1] and referred by the P+F development process [D2].

As the PS2 is a modification project, the specific FSM steps and phases relevant for this project is outlined in the Impact analysis document [D13] which also takes the role of the V&V plan when it comes to tracking the different work products created in this project.

Conclusion: The objectives of the standard are fulfilled by the Pepperl+Fuchs GmbH functional safety management system.

4.2.3 Documentation

A set of templates and guidelines which controls the common layout of documents together with basic properties as document name or number, revision and approval identification exists and is part of the normal quality system of Pepperl+Fuchs GmbH.

Conclusion: The objectives of the standard are fulfilled by the Pepperl+Fuchs GmbH functional safety management system.

4.2.4 Training and competence recording

The competence tracking for the project members is contained within the V&V plan [D1]. In addition to the extensive experience in safety and non-safety HW development, the safety competence within the project is also ensured by a separate safety support group including external safety experts which were available throughout the project.

Conclusion: The objectives of the standard are fulfilled by the Pepperl+Fuchs GmbH functional safety management system.

4.2.5 Configuration Management

The handling of configurations is described in the V&V plan [D1]. This includes responsibilities for the activities, the items to be under version control and the defined tools and methods for this.

Conclusion: The objectives of the standard are fulfilled by the Pepperl+Fuchs GmbH functional safety management system.

4.3 Safety Requirement Specification

Objectives of the Safety Requirement Specification

The main objective of the related IEC 61508 requirements is to:

- Specify the requirements for each E/E/PE safety-related system, in terms of the required safety functions and the required safety integrity, in order to achieve the required functional safety.

4.3.1 Safety Requirement Specification and traceability into design

The responsibility of the SRS is covered by the Requirements Profile [D3] and supported by the Design Specification [D4]. The requirements Profile contains a background for the project together with a description of the intended use and targeted application areas. Each requirement has an allocation to the responsible person, an identity which both identifies the type of requirement and the safety relevance. The used requirement identity supports requirements traceability both to the Design Specification [D4] and to the V&V Test Specification [D11] (validation test specification).

Conclusion: The objectives of the standard are fulfilled by the Pepperl+Fuchs GmbH functional safety management system.

4.4 Change and modification management

Objectives of change and modification management

The main objective of the related IEC 61508 requirements is to:

- Ensure that the required safety integrity is maintained after corrections, enhancements or adaptations to the E/E/PE safety-related systems.

4.4.1 Change and modification procedure

A modification procedure is defined in the V&V plan [D1]. This is implemented for product changes starting with formal validation tests as there is no integration test planned for this type of product. The defined modification procedure, containing a procedure for Impact Analysis including checklists, in combination with the generic development model fulfils the objectives of IEC 61508.

This project, PS2, also shows that the modification process as described in the V&V plan [D1] is implemented and followed according the process description. The key document Impact analysis [D13], is used to both describe the change as well as defining the relevant activities and tracking them in the project.

Conclusion: The objectives of the standard are fulfilled by the Pepperl+Fuchs GmbH functional safety management system.

4.5 Hardware Design

Objectives of hardware design

The main objectives of the related IEC 61508 requirements are to:

- Create E/E/PE safety-related systems conforming to the specification for the E/E/PES safety requirements (comprising the specification for the E/E/PES safety functions requirements and the specification for the E/E/PES safety integrity requirements).
- Ensure that the design and implementation of the E/E/PE safety-related systems meets the specified safety functions and safety integrity requirements.

Objectives of hardware design / probabilistic properties

The main objective of the related IEC 61508 requirements is to:

- Ensure that the design and implementation of the E/E/PE safety-related systems meets the specified safety functions and safety integrity requirements.

4.5.1 Hardware architecture design

The HW architecture is described by the Design Specification [D4]. The hardware design follows the rules of modularization, the use of well known components and de-rating.

Conclusion: The objectives of the standard are fulfilled by the Pepperl+Fuchs GmbH functional safety management system.

4.5.2 Hardware Design / Probabilistic properties

The detailed HW design is partly described by the Design Specification [D4] and by the circuit diagram [D6]. An FMEDA Report [D5] is documenting the probabilistic calculations for the applicable configurations of the device. The assumptions of the FMEDA are confirmed by a documented Fault Insertion Test [D7].

Conclusion: The objectives of the standard are fulfilled by the Pepperl+Fuchs GmbH functional safety management system.

4.5.2.1 FMEDA - KFD0-RSH-1.4S.PS2:

The Safe Failure Fraction was confirmed additionally by the Fault insertion tests. The PFH and PFD_{AVG} listed below shows SIL 3 capability.

ETS configuration:

Table 1 Failure rates according to IEC 61508

λ_s^1	λ_{dd}	λ_{du}	SFF
139,5 FIT	0 FIT	7,1 FIT	95,2%

Table 2 PFD_{AVG} values

	T[Proof] = 1 year
PFH = 7,1E-09	$PFD_{AVG} = 3,1E-05$

¹ Note that the S category includes failures that do not cause a spurious trip

4.5.2.2 FMEDA - KFD0-RSH-1.4S.PS2:

The Safe Failure Fraction was confirmed additionally by the Fault insertion tests. The PFH and PFD_{AVG} listed below shows SIL 3 capability.

DTS configuration:

Table 3 Failure rates according to IEC 61508

λ_s^2	λ_{dd}	λ_{du}	SFF
144,7 FIT	0 FIT	1,83 FIT	98,7%

Table 4 PFD_{AVG} values

	T[Proof] = 1 year
PFH = 1,83E-09	PFD _{AVG} = 8,01E-06

4.6 Verification & Validation

Objectives of HW related verification & validation activities

The main objectives of the related IEC 61508 requirements are to:

- Demonstrate, for each phase of the overall, E/E/PES and software safety lifecycles (by review, analysis and/or tests), that the outputs meet in all respects the objectives and requirements specified for the phase.
- Test and evaluate the outputs of a given phase to ensure correctness and consistency with respect to the products and standards provided as input to that phase.
- Integrate and test the E/E/PE safety-related systems.
- Ensure that the design and implementation of the E/E/PE safety-related systems meets the specified safety functions and safety integrity requirements.
- Plan the validation of the safety of the E/E/PE safety-related systems.
- Validate that the E/E/PE safety-related systems meet, in all respects, the requirements for safety in terms of the required safety functions and the safety integrity.

4.6.1 HW related V&V activities

The V&V plan [D1] defines the required verification activities related to hardware and system including documentation, verification planning, test strategy and requirements tracking to validation test.

All applicable analysis steps as e.g. FMEDA [D5] and de-rating analysis [part of D4] were planned and verified to be successful. All relevant practical tests as e.g. fault insertion test [D7] and validation tests [D11] were planned and successfully executed [D12].

² Note that the SU category includes failures that do not cause a spurious trip

All specified safety requirements were tracked and successfully validated [D12]. The test specification [D11] contains the required description of the test, acceptance criteria and the documented result. Other applicable aspects as the used configuration and version are documented in order to enable a re-test of the product at a later stage.

Conclusion: The objectives of the standard are fulfilled by the Pepperl+Fuchs GmbH functional safety management system.

4.7 Safety Manual

Objectives of the Safety Manual

The main objective of the related IEC 61508 requirements is to:

- Develop procedures to ensure that the required functional safety of the E/E/PE safety-related systems is maintained during operation and maintenance.

4.7.1 Operation, installation and maintenance requirements

The responsibility of P+F is to provide the end-users with a Safety Manual [D8], with all necessary product information in order to enable a correct and safe engineering of the product in a safety instrumented function. Additionally, the provided information enables the end-user to perform the required verification analysis steps of a safety instrumented function, e.g. SFF, PFD/PFH, proof test interval and procedure, etc. The Safety Manual partly also refers the data sheets which are available of the official web-site for details regarding environmental conditions and other approvals of the product.

Conclusion: The objectives of the standard are fulfilled by the Pepperl+Fuchs GmbH functional safety management system.

5 Agreement for future assessment

Areas of possible improvements have been identified during the assessment. However, these are not assessed to be in contradiction to an overall positive judgment of the subject.

Recommendations have been given by *exida* Certification S.A. to Pepperl+Fuchs GmbH as confidential information for the following lifecycle phases / sub-phases:

- Documentation
- Safety requirement specification
- Change and modification management
- HW related V&V activities
