IUH-F192-V1-*
Read/Write Head for IDENTControl
With regard to the supply of products, the current issue of the following document is applicable: The General Terms of Delivery for Products and Services of the Electrical Industry, published by the Central Association of the Electrical Industry (Zentralverband Elektrotechnik und Elektroindustrie (ZVEI) e.V.) in its most recent version as well as the supplementary clause: "Expanded reservation of proprietorship"

1 Introduction

1.1 Content of this Document

This document contains information required to use the product in the relevant phases of the product life cycle. This may include information on the following:

- Product identification
- Delivery, transport, and storage
- Mounting and installation
- Commissioning and operation
- Maintenance and repair
- Troubleshooting
- Dismounting
- Disposal

Note!
For full information on the product, refer to the further documentation on the Internet at www.pepperl-fuchs.com.

The documentation comprises the following parts:

- This document
- Datasheet

In addition, the documentation may comprise the following parts, if applicable:

- EU-type examination certificate
- EU declaration of conformity
- Attestation of conformity
- Certificates
- Control drawings
- Instruction manual
- Other documents

1.2 Target Group, Personnel

Responsibility for planning, assembly, commissioning, operation, maintenance, and dismounting lies with the plant operator.

Only appropriately trained and qualified personnel may carry out mounting, installation, commissioning, operation, maintenance, and dismounting of the product. The personnel must have read and understood the instruction manual and the further documentation.

Prior to using the product make yourself familiar with it. Read the document carefully.
1.3 Symbols Used
This document contains symbols for the identification of warning messages and of informative messages.

Warning Messages
You will find warning messages, whenever dangers may arise from your actions. It is mandatory that you observe these warning messages for your personal safety and in order to avoid property damage.
Depending on the risk level, the warning messages are displayed in descending order as follows:

Danger!
This symbol indicates an imminent danger.
Non-observance will result in personal injury or death.

Warning!
This symbol indicates a possible fault or danger.
Non-observance may cause personal injury or serious property damage.

Caution!
This symbol indicates a possible fault.
Non-observance could interrupt the device and any connected systems and plants, or result in their complete failure.

Informative Symbols
Note!
This symbol brings important information to your attention.

Action
This symbol indicates a paragraph with instructions. You are prompted to perform an action or a sequence of actions.
2 Certificates and Approvals

2.1 Declaration of Conformity (RE Directive 2014/53/EU)

This product was developed and manufactured under observance of the applicable European standards and guidelines.

Note!

A Declaration of Conformity can be requested from the manufacturer or downloaded from www.pepperl-fuchs.com.

The product manufacturer, Pepperl+Fuchs GmbH, 68307 Mannheim, has a certified quality assurance system that conforms to ISO 9001.

2.2 FCC-Information

FCC ID: IREIUH-F192-V1

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

1. this device may not cause harmful interference, and
2. this device must accept any interference received, including interference that may cause undesired operation.

Attention:
Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

Note:

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

FCC Notice

To comply with FCC part 15 rules in the United States, the system must be professionally installed to ensure compliance with the Part 15 certification. It is the responsibility of the operator and professional installer to ensure that only certified systems are deployed in the United States. The use of the system in any other combination (such as co-located antennas transmitting the same information) is expressly forbidden.

FCC Exposure Information

To comply with FCC RF exposure compliance requirements, the antennas used for this transmitter must be installed to provide a separation distance of at least 30 cm from all persons and must not be co-located or operated in conjunction with any other antenna or transmitter.
2.3 IC-Information

This device complies with Industry Canada licence-exempt RSS standard(s) and with part 15 of the FCC Rules. Operation is subject to the following two conditions:
1. this device may not cause interference, and
2. this device must accept any interference, including interference that may cause undesired operation of the device.

IC Exposure Information

To comply with IC RF exposure compliance requirements, the antennas used for this transmitter must be installed to provide a separation distance of at least 30 cm from all persons and must not be co-located or operated in conjunction with any other antenna or transmitter.

2.4 UL Information

Technical Data and Environmental Conditions

This device is for indoor use only.

This device may be operated in altitudes up to 2000 m.

The ambient temperature range is from -20 °C to +70 °C for operation with non-transmission periods, or -20 °C to +60 °C for continuous transmission mode. The pollution degree is 2.

The maximum relative humidity is 80 % for temperatures up to 31 °C, decreasing linearly to 50 % relative humidity at 40 °C.

Nominal power supply voltage is 24 V<sub>DC</sub>; voltage range is 20 ... 30 V<sub>DC</sub>. Supply must be PELV (Protective Extra Low Voltage). The overvoltage category II is applied.

This is the case if Pepperl+Fuchs IDENTControl control interface is used.

Protection class IP67 is not included in the UL approval. The protection class is tested by Pepperl+Fuchs GmbH.

The external circuits intended to be connected to this unit must be galvanically isolated from the mains supply or hazardous live voltage by reinforced or double insulation and fall within the limits specified in clauses 6.3 and 9.4 of UL 61010-1.

2.5 Additional Country-Specific Approvals

For all current approvals see the data sheet of your read / write head under www.pepperl-fuchs.com.
3 Product Description

3.1 RFID Frequency Bands

The following diagram shows the position of the different frequency bands used for RFID. The read/write heads described in this manual operate in the frequency range from 865 MHz ... 868 MHz and from 902 MHz ... 928 MHz, highlighted in color.

- 100 kHz ... 135 kHz: Low frequency LF
- 13.56 MHz: High frequency HF
- 865 MHz ... 868 MHz (Europe), 902 MHz ... 928 MHz (USA), 920 MHz ... 925 MHz (China): ultra-high frequency UHF
- 2.45 GHz and 5.8 GHz: Microwave MW

3.2 UHF General

3.2.1 Advantages of UHF

- Long detection range
- UHF tags are available as cheap and space-saving adhesive labels
- High transfer rates
- Tag is available with a large working memory (user memory)
- Bulk detection

3.2.2 Applications for UHF Systems

- Identification in galvanic coating or painting systems used in automotive production,
- Identification feasible over greater distances than with LF and HF systems,
- Identification of automotive superstructures in automotive production,
- Pallet identification and measurement of goods movements in the logistics sector, and
- Access control at unloading stations with HGV identification.
Memory Structure of a Tag in Accordance with EPC Gen 2 (ISO/IEC 18000-63)

The memory module of an EPC Gen 2 (ISO/IEC 18000-63) tag is split into four segments. The main contents of these segments are:

<table>
<thead>
<tr>
<th>Segment</th>
<th>Function</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bank 00</td>
<td>Password management</td>
<td>Depending on the tag type, see table &quot;Tag Types, UHF&quot; on page 53/column &quot;Bank 00&quot;</td>
</tr>
<tr>
<td>Bank 01</td>
<td>Unique Item Identifier (UII) Electronic Product Code (EPC)</td>
<td>Depending on the tag type, see table &quot;Tag Types, UHF&quot; on page 53/column &quot;UII/EPC&quot;</td>
</tr>
<tr>
<td>Bank 10</td>
<td>Tag ID (TID)</td>
<td>4 bytes (MDID, TMN) + 0, 4, or 8 bytes</td>
</tr>
<tr>
<td>Bank 11</td>
<td>User memory</td>
<td>Depending on the tag type, see table &quot;Tag Types, UHF&quot; on page 53/column &quot;User Data&quot;</td>
</tr>
</tbody>
</table>
Bank 00: Password Management

The segment Bank 00 contains the password management information, comprising the access password and the kill password. The read/write head manages the kill password with the standard read/write commands SW and SR. The access password is not supported. See "Single Read Words SR" on page 47, see "Single Write Words SW" on page 47, and see "Memory Module for Tag Accesses to the "Memory Bank" MB" on page 58.

Bank 01: UII/EPC

In addition to the Unique Item Identifier (UII), the segment Bank 01 contains a calculated checksum CRC (Cyclic Redundancy Check) for verifying data on the tag and the protocol control (PC) area. The PC area contains:

- The length of the UII
- The Application Family Identifier (AFI) box
- A bit switch that shows whether the UII contains an EPC sequence of numbers in accordance with ISO (see chapter 3.2.4)
- A bit switch that shows whether data is stored in segment bank 11 (if present)

The data is addressed via the following commands: single read special read-only code (SS), single write special read-only code (SP), and enhanced read special read-only code (ES). See "Single Read Special Read-Only Code SS" on page 45, see "Single Write Special Read-Only Code SP" on page 46, and see "Enhanced Read Special Read-Only Code ES" on page 45.

Bank 10: TID

The segment Bank 10 contains the tag identifier (TID), consisting of the part number and optional serial number of the tag. This data is permanently stored without being changed. The first byte denotes the class of the tag with E0_hex, E2_hex, or E3_hex. The rest of the TID depends on the class, and can be derived from standard ISO/IEC 18000-63.

Example:

All tags with the class EPC Gen 2 (ISO/IEC 18000-63) are marked with E2_hex. The TID is comprised as follows:

- 4 bytes: part number of the tag
  - 1 byte: identifier
  - 12 bits: tag mask designer identifier (MDID)
  - 12 bits: tag model number (TMN), defined by the manufacturer:
- 4 or 8 bytes: serial number of the tag

Depending on the manufacturer, the serial numbers do not have to be unique or may even be omitted.

The data in segment Bank 10 can be output via the single read read-only code (SF) and enhanced read read-only code (EF) commands. (see "Single Read Read-Only Code SF" on page 44 and see "Enhanced Read Read-Only Code EF" on page 44)

Bank 11: User Memory

Segment Bank 11 contains an area to which the user has free access. This size of this area depends on the chip type, or the area may not be present.

The data in segment Bank 11 is addressed via the single read words (SR), single write words (SW), enhanced read words (ER), and enhanced write words (EW) commands. (see "Single Read Words SR" on page 47, see "Single Write Words SW" on page 47, see "Enhanced Read Words ER" on page 47, and see "Enhanced Write Words EW" on page 48)
3.2.4 Elektronik Product Code (EPC)

The electronic product code is a unique identifier in the form of a sequence of numbers. The number sequence has a set structure and a length of 64 bits, 80 bits, 96 bits, or longer (depending on the EPC Ident number used). This number sequence is saved to the RFID tag, offering worldwide unique identification of the tagged object.

The system of Electronic Product Codes (EPC) was defined by GS1/EPCglobal for use in inventory management. Tags with memory banks for EPC codes must be programmed by the user. The memory of new tags must not contain any valid EPC codes. The EPC numbers are managed and assigned by GS1. To obtain EPC numbers, please contact the GS1 branch in your country (http://www.gs1.com/contact).

The electronic product code is defined by EPCglobal with at present 13 different encoding schemes. SGTIN-96 (serialized global trade item number) is given here as an example of a frequently used encoding scheme. SGTIN-96 has a defined format, and is structured as follows:

1. **Header**: The header specifies the EPC standard used, and denotes the number sequence.
2. **Filter value**: Denotes the unit of the product, for example, end product, additional packaging, pallet.
3. **Partition**: Denotes the point at which the following company prefix ends and the object data begins.
4. **Company Prefix**: Assigned sequence of numbers that identifies the producer.
5. **Object class**: Sequence of numbers that describes the object, e.g., item number.

The company prefix and the object class are each of variable length, but together are always 44 bits long.

6. **Serial number**: Sequence of numbers that identifies the item, e.g., the sequential serial number of the item.

<table>
<thead>
<tr>
<th>Length</th>
<th>Header</th>
<th>Filter value</th>

</table>

3.2.5 Influence of Various Materials on the Sensing Range

In the UHF range, the nature of the surrounding area and the surface to which the transponder is secured have a serious influence on the range that the system can attain. The UHF transponder cannot be mounted on metal without requiring adaptations. Glass has a negative influence on the sensing range when used as a mounting surface. If a UHF transponder is mounted on damp material, the sensing range is much poorer than the range of a transponder mounted on dry material. The mounting surface often affects the read range much more than the material between the transponder and the read/write head. The graph shows the effect of different materials on the sensing range.
3.2.6 Dense Reader Mode (DRM)

**Europe**

A special operating mode for read/write tags in accordance with the specification EPC Gen 2 (ISO/IEC 18000-63) allows several read/write heads to be operated close to each other simultaneously without interference.

In accordance with EN 302208, the read/write head uses only channels 4, 7, 10, and 13 in this mode for transmission (read/write head $\rightarrow$ read/write tag communication path). The transmission power is a maximum of $2 \ W_{ERP}$ in accordance with EN 302208.

![Diagram](image)

**Figure 3.1**

The response from the read/write tag appears via the frequency offset, which is achieved by the modulation used in this mode on the two adjacent channels. Due to the high level difference between the transmission channels and the response channels, this technology offers major benefits for reusing frequencies.
3.2.7 Frequency Hopping Spread Spectrum

With FHSS (Frequency Hopping Spread Spectrum), the information to be transmitted is distributed successively through multiple channels. Only one frequency channel is used at any one time. This results in a larger bandwidth for the entire signal, in spite of the fact that each channel has a smaller bandwidth. In this section the channel assignment for China and the USA is shown graphically. For both assignments, different parameters apply, such as channel number and channel bandwidth. Different parameterizations apply in other countries.

**China**

In China, the frequency range 920 MHz ... 925 MHz is available for UHF-RFID read/write heads. The range is split into channels, each with a bandwidth of 250 kHz. A maximum of 2 \( W_{ERP} \) is permitted on 16 of the available channels. The transmission power is indicated in \( W_{ERP} \). FHSS is used with a maximum retention time of two seconds. The UHF RFID read/write head for China uses channel 2 to 17.

**United States**

The ISM band from 902 MHz ... 928 MHz is available in the USA. The band is split into 50 channels, each with a 500 kHz bandwidth. FHSS with a maximum retention time of 0.4 seconds is used. All channels must be used. Channel restriction is not permitted.

In contrast to the read/write heads for Europe and China, the transmission power is indicated in \( W_{eirp} \). A maximum of 4 \( W_{eirp} \) is permitted on all channels.
3.2.8 Relevant Standards for UHF

European radio standards: EN 300220 and EN 302208

Usage recommendations for RFID type labels, information about recycling, installation of readers and antennae: ISO/IEC TR 24729 parts 1-4

Installation and commissioning of UHF-RFID systems: ETSI TR 102436

Description of air interface: EPC Gen 2 (ISO/IEC 18000-63)

3.3 Countries of Use

Note!

Country Identifier

All IUH-F192-V1-* read/write heads operate within their maximum frequency range with the appropriate settings for the relevant country. You must set the correct country identifier when commissioning for the first time. See chapter 5.2.

Note!

If you wish to use the IUH-F192-V1-* read/write head in a country not included in this chapter, make sure the relevant values for the read/write head are consistent with the local conditions before use.

Note!

Transmission License

A country-specific transmission license is required to operate the read/write head. In the European Union and Turkey, the manufacturer's EU declaration of conformity constitutes an adequate license. A currently valid transmission license may not exist for all countries of use listed in this chapter, as transmission licenses are temporary in some countries. All currently valid transmission licenses can be found in the data sheet for the respective read/write head at www.pepperl-fuchs.com

The country identifier also defines the frequency access method used.

Frequency Access Method

- In many countries, including the USA and China, a frequency hopping spread spectrum is used. See chapter 3.2.7. The number and position of the frequencies is fixed and cannot be changed by the user. All channels are used.

- A programmable frequency list is used in other countries, including the European Union, Singapore, Vietnam, and India. You can compile this frequency list from a specified set of channels. Four channels are specified in the European Union as appropriate for dense reader mode in accordance with EN 302208. See chapter 3.2.6. When selecting this country identifier, you can configure one or more channels, or all four channels.
3.3.1 European Union

In the European Union, the use of RFID in the UHF range is regulated by EN 302208.

- UHF frequency range: 865 MHz ... 868 MHz
- Radiated power: 10 mW ... 2000 mW_{ERP}; Default = 500 mW_{ERP} (IUH-F192-V1-FR1)
- Channel bandwidth: 200 kHz
- Channel spacing: 600 kHz
- Frequency access method: programmable frequency list
- Number of predefined channels: 4
  Programmed channels: 4, 7, 10, 13
  Center frequencies: 865.7 MHz, 866.3 MHz, 866.9 MHz, 867.5 MHz
  Up to four channels can be parameterized and used in sequence.
  Default: dense reader mode on channel 4, 10, 7, 13. See chapter 3.2.6.

3.3.2 Argentina

The regulations for the UHF frequency range in Argentina are the same as the regulations for the UHF frequency range in the USA. See chapter 3.3.19.

3.3.3 Australia

In Australia, the use of RFID in the UHF range is regulated as follows:

- UHF frequency range: 920 MHz ... 926 MHz
- Radiated power: 10 mW ... 4000 mW_{EIRP}; Default = 800 mW_{EIRP} (IUH-F192-V1-FR2)
- Channel bandwidth: 500 kHz
- Channel spacing: 500 kHz
- Frequency access method: frequency hopping spread spectrum. See chapter 3.2.7.
- Number of channels: 12
  Channels used: 1, 2, 3, ... 12
  Center frequencies: 919.75 MHz + (M x 0.5) MHz
  All 12 channels are always used.

3.3.4 Brazil

In Brazil, the use of RFID in the UHF range is regulated as follows:

- UHF frequency range: 915 MHz ... 928 MHz
- Radiated power: 10 mW ... 4000 mW_{EIRP}; Default = 800 mW_{EIRP} (IUH-F192-V1-FR2)
- Channel bandwidth: 250 kHz
- Channel spacing: 250 kHz
- Frequency access method: frequency hopping spread spectrum. See chapter 3.2.7.
- Number of channels: 52
  Channels used: 1, 2, 3, ... 52
  Center frequencies: 914.875 MHz + (M x 0.25) MHz
  All 52 channels are always used.

3.3.5 Canada

The regulations for the UHF frequency range in Canada are the same as the regulations for the UHF frequency range in the USA. See chapter 3.3.19.
3.3.6 China

In China, the use of RFID in the UHF range is regulated by the provisions of the China Ministry of Industry and Information Technology (CMIIT).

- UHF frequency range: 920 MHz ... 925 MHz
- Radiated power: 6 mW ... 2000 mW_{ERP}; Default = 500 mW_{ERP} (IUH-F192-V1-FR2)
- Channel bandwidth: 250 kHz
- Channel spacing: 250 kHz
- Frequency access method: frequency hopping spread spectrum (China). See chapter 3.2.7.
- Number of channels: 16
  - Channels used: 2, 3, 4, ... 17
  - Center frequencies: 920.125 MHz + (M x 0.25) MHz
  - All 16 channels are always used.

3.3.7 Hong Kong

The regulations for the UHF frequency range of 865 MHz to 868 MHz in Hong Kong are the same as the regulations for the UHF frequency range in the European Union. See chapter 3.3.1.

The regulations for the UHF frequency range of 920 MHz to 925 MHz in Hong Kong are the same as the regulations for the UHF frequency range in Thailand. See chapter 3.3.18.

3.3.8 India

In India, the use of RFID in the UHF range is regulated in accordance with EN 302208.

- UHF frequency range: 865 MHz ... 867 MHz
- Radiated power: 10 mW ... 2000 mW_{ERP}; Default = 500 mW_{ERP} (IUH-F192-V1-FR1)
- Channel bandwidth: 200 kHz
- Channel spacing: 200 kHz
- Frequency access method: programmable frequency list
- Number of predefined channels: 10
  - Programmable channels: 1, 2, 3, ... 10
  - Center frequencies: 865.1 MHz, 865.3 MHz, 865.5 MHz, 865.7 MHz, 865.9 MHz, 866.1 MHz, 866.3 MHz, 866.5 MHz, 866.7 MHz, 866.9 MHz
  - Up to ten channels can be parameterized and used in sequence.
  - Default: dense reader mode on channel 1, 7, 4, 10. See chapter 3.2.6.

3.3.9 Japan

In Japan, the use of RFID in the UHF range is regulated as follows:

- UHF frequency range: 916.7 MHz ... 920.5 MHz
- Radiated power: 10 mW ... 4000 mW_{EIRP}; Default = 800 mW_{EIRP} (IUH-F192-V1-FR2)
- Channel bandwidth: 200 kHz
- Channel spacing: 1200 kHz
- Frequency access method: programmable frequency list.
- Number of predefined channels: 4
  Programmable channels: 5, 11, 17, 23
  Center frequencies: 916.8 MHz, 918.0 MHz, 919.2 MHz, 920.4 MHz
  Up to four channels can be parameterized and used in sequence.
  Default: dense reader mode on channel 5, 17, 11, 23. See chapter 3.2.6.

3.3.10 Colombia
The regulations for the UHF frequency range in Colombia are the same as the regulations for the UHF frequency range in the USA. See chapter 3.3.19.

3.3.11 Malaysia
In Malaysia, the use of RFID in the UHF range is regulated as follows:
- UHF frequency range: 919 MHz ... 923 MHz
- Radiated power: 6 mW ... 2000 mW_{ERP}; Default = 500 mW_{ERP} (IUH-F192-V1-FR2)
- Channel bandwidth: 500 kHz
- Channel spacing: 500 kHz
- Frequency access method: frequency hopping spread spectrum. See chapter 3.2.7.
- Number of channels: 8
  Channels used: 1, 2, 3, ... 8
  Center frequencies: 918.75 MHz + (M x 0.5) MHz
  All 8 channels are always used.

3.3.12 Morocco
In Morocco, the use of RFID in the UHF range is regulated in accordance with EN 302208:
- UHF frequency range: 867.6 ... 868.0 MHz
- Radiated Power: 3 ... 500 mW_{erp}; Default = 50 mW_{erp}
- Channel bandwidth: 200 kHz
- Channel spacing: 200 kHz
- Frequency access method: programmable frequency list.
- Number of predefined channels: 1
  Programmable channels: 1, 2
  Center frequencies: 867.7 MHz, 867.9 MHz
  Up to two channels can be parameterized simultaneously and used in sequence.
  Default: dense reader mode on channel 1, 2. See chapter 3.2.6.

3.3.13 Mexico
The regulations for the UHF frequency range in Mexico are the same as the regulations for the UHF frequency range in the USA. See chapter 3.3.19.

3.3.14 New Zealand
In New Zealand, the use of RFID in the UHF range is regulated as follows:
- UHF frequency range: 921.5 MHz ... 928 MHz
- Radiated power: 10 mW ... 4000 mW_{EIRP}; Default = 800 mW_{EIRP} (IUH-F192-V1-FR2)
- Channel bandwidth: 500 kHz
Channel spacing: 500 kHz
- Frequency access method: frequency hopping spread spectrum. See chapter 3.2.7.

- Number of channels: 13
  - Channels used: 1, 2, 3, ... 13
  - Center frequencies: 921.25 MHz + (M x 0.5) MHz
    - All 13 channels are always used.

3.3.15 Russia

In Russia, the use of RFID in the UHF range is regulated in accordance with EN 302208:
- UHF frequency range: 866 MHz ... 867.6 MHz
- Radiated power: 10 mW ... 2000 mW$_{ERP}$; Default = 500 mW$_{ERP}$ (IUH-F192-V1-FR1)
- Channel bandwidth: 200 kHz
- Channel spacing: 200 kHz
- Frequency access method: programmable frequency list.
- Number of predefined channels: 8
  - Programmable channels: 1, 2, 3, ... 8
  - Center frequencies: 866.1 MHz, 866.3 MHz, 866.5 MHz, 866.7 MHz, 866.9 MHz, 867.1 MHz, 867.3 MHz, 867.5 MHz
    - Up to eight channels can be parameterized and used in sequence.
      - Default: dense reader mode on channel 1, 7, 4. See chapter 3.2.6.

3.3.16 Singapore

In Singapore, the use of RFID in the UHF range of 866 MHz to 868 MHz is regulated in accordance with EN 302208.
- UHF frequency range: 866 MHz ... 868 MHz
- Radiated power: 10 mW ... 500 mW$_{ERP}$; Default = 500 mW$_{ERP}$ (IUH-F192-V1-FR1)
- Channel bandwidth: 200 kHz
- Channel spacing: 200 kHz
- Frequency access method: programmable frequency list
- Number of predefined channels: 10
  - Programmable channels: 1, 2, 3, ... 10
  - Center frequencies: 866.1 MHz, 866.3 MHz, 866.5 MHz, 866.7 MHz, 866.9 MHz, 867.1 MHz, 867.3 MHz, 867.5 MHz, 867.7 MHz, 867.9 MHz
    - Up to ten channels can be parameterized and used in sequence.
      - Default: dense reader mode on channel 1, 7, 4, 10. See chapter 3.2.6.

In Singapore, the use of RFID in the UHF range of 920 MHz to 925 MHz is regulated as follows:
- UHF wavelength: 920 MHz ... 925 MHz
- Radiated power: 6 mW ... 2000 mW$_{ERP}$; Default = 500 mW$_{ERP}$ (IUH-F192-V1-FR2)
- Channel bandwidth: 500 kHz
- Channel spacing: 500 kHz
- Frequency access method: frequency hopping spread spectrum. See chapter 3.2.7.
Number of channels: 10
Channels used: 1, 2, 3, ... 10
Center frequencies: 919.75 MHz + (M x 0.5) MHz
All ten channels are always used.

3.3.17 South Korea
In South Korea, the use of RFID in the UHF range is regulated as follows:
- UHF frequency range: 917.2 MHz ... 920.4 MHz
- Radiated power: 10 mW ... 4000 mW_{EIRP}; Default = 800 mW_{EIRP} (IUH-F192-V1-FR2)
- Channel bandwidth: 200 kHz
- Channel spacing: 600 kHz
- Frequency access method: frequency hopping spread spectrum. See chapter 3.2.7.
- Number of channels: 6
  Channels used: 1, 4, 7, 10, 13, 16
  Center frequencies: 917.1 MHz + (M x 0.20) MHz
  All 6 channels are always used.

3.3.18 Thailand
In Thailand, the use of RFID in the UHF range is regulated as follows:
- UHF frequency range: 920 MHz ... 925 MHz
- Radiated power: 10 mW ... 4000 mW_{EIRP}; Default = 800 mW_{EIRP} (IUH-F192-V1-FR2)
- Channel bandwidth: 500 kHz
- Channel spacing: 500 kHz
- Frequency access method: frequency hopping spread spectrum. See chapter 3.2.7.
- Number of channels: 10
  Channels used: 1, 2, 3, ... 10
  Center frequencies: 919.75 MHz + (M x 0.5) MHz
  All ten channels are always used.

3.3.19 United States of America
In the USA, the use of RFID in the UHF range is regulated in accordance with the provisions set out by the Federal Communications Commission (FCC).
- UHF frequency range: 902 MHz ... 928 MHz
- Radiated power: 10 mW ... 4000 mW_{EIRP}; Default = 800 mW_{EIRP} (IUH-F192-V1-FR2-02)
- Channel bandwidth: 500 kHz
- Channel spacing: 500 kHz
- Frequency access method: frequency hopping spread spectrum (USA). See chapter 3.2.7.
- Number of channels: 50
  Channels used: 1, 2, 3, ... 50
  Center frequencies: 902.25 MHz + (M x 0.5) MHz
  All 50 channels are always used.
3.3.20 Vietnam

The regulations for the UHF frequency range in Vietnam are the same as the regulations for the UHF frequency range in Singapore. See chapter 3.3.16.

3.4 General Functions and Features

IUH-F192-V1-FR*

![IUH-F192-V1-FR*](image)

**Figure 3.4**

**Functions**

The read/write head was developed for reading and writing passive read/write tags with an ultra-high operating frequency.

**Detection Range**

The detection range is typically 4 meters. Tags that comply with EPC Gen 2 (ISO/IEC 18000-63) are supported.

**Maximum Frequency Range**

The IUH-F192-V1-FR1 read/write head can be operated in the frequency range from 865 MHz to 868 MHz. The IUH-F192-V1-FR2 read/write head can be operated in the frequency range from 902 MHz to 928 MHz.

**Features**

The read/write head has the following features:

- 2 x 3 function indicator LEDs
- Industrial housing
- Bulk detection
- Connects to the IDENTControl via connector V1 (M12 x 1)
- Protected against electrostatic discharge
Integrated antenna
The IUH-F192-V1-FR1 and IUH-F192-V1-FR2 read/write heads have a linear dual-polarized antenna. The read/write heads can transmit and receive waves with horizontal and vertical polarization.

Electrical specifications
- Operating voltage $U$: 20 ... 30 $V_{DC}$
- Current consumption $I$: < 350 mA
- Power consumption $P_0$: $\leq$ 10 W

3.5 Indicators and Operating Elements
The IUH-F192-V1-* read/write head has 2 x 3 LEDs, which are green/blue/yellow. The various indicators denote:
- Green LED:
  - Continuously on - Power on
  - Flashing - Region code must be set. See chapter 5.2.
- Yellow LED: Read/write operation successful
- Blue LED: Transmission mode

3.6 Connection

Caution!
Cable specifications
The maximum permissible temperature of the connection cable must be at least +80 °C.
The minimum diameter of the connection cable must be 22 AWG or 0.34 mm².

IUH-F190-V1-*
The IUH-F190-V1-* read/write head is connected to the IDENTControl control interface via the M12 x 1 connector.

Figure 3.5

1. $+ < 30 V_{DC}, < 450$ mA (20 ... 30 $V_{DC}$)
2. Data input/output A, RS-485, -7 V ... +12 V
3. 0 V
4. Data input/output B, RS-485, -7 V ... +12 V
5. Data output 0 ... 3.3 $V_{DC}$
IUT-F190-R4-V1-*

The IUT-F190-R4-V1-* read/write head is connected to an RS-485 serial interface of the parent device via the M12 x 1 connector via a point-to-point connection. The read/write head has an internal terminator on the RS-485 interface. For this reason, only one read/write head is provided within an RS-485 network. It is not possible to build an RS-485 network with multiple read/write heads. The factory-set transfer rate of the interface is 38,400 bit/s.

![Ground connection diagram](image)

Figure 3.6

1. $+ < 30 \text{ V}_{DC}, < 450 \text{ mA} \ (20 \ldots 30 \text{ V}_{DC})$
2. Data input/output A, RS-485, -7 V ... +12 V
3. 0 V
4. Data input/output B, RS-485, -7 V ... +12 V
5. Data output 0 ... 3.3 V$_{DC}$

**Ground connection**

The ground connection of the read/write head is positioned on the right-hand side when viewed from the front, if the cable outlet is facing downward. The ground conductor is screwed to the housing with a crimp connector. In order to guarantee safe grounding, mount the serrated washer between the crimp connectors and the housing.

The screw connection, which is marked with the symbol ↓ or ← depending on the device type, is used to connect the functional earth.

![Connection diagram](image)

1. Housing
2. Serrated lock washer
3. Crimp connector
4. Lock screw

Use a ground conductor lead with a cross-section of at least 4 mm$^2$.

Tighten the retaining bolt to a tightening torque of 1.6 Nm ± 0.4 Nm.
3.7 Scope of Delivery
- Read/write head
- Quick start guide

3.8 Accessories
3.8.1 IDENTControl
The IUH-F190-V1-* read/write head can be connected to Pepperl+Fuchs IDENTControl control interfaces.

4 Installation

4.1 Storage and Transport

Keep the original packaging. Always store and transport the device in the original packaging.

Store the device in a clean and dry environment. The permitted ambient conditions must be considered, see datasheet.

4.2 Unpacking

Check the product for damage while unpacking. In the event of damage to the product, inform the post office or parcel service and notify the supplier.

Check the package contents against your purchase order and the shipping documents for:

- Delivery quantity
- Device type and version in accordance with the type label
- Any accessories ordered

Retain the original packaging in case you have to store or ship the device again at a later date.

Should you have any questions, please contact Pepperl+Fuchs.

4.3 Mounting

**Warning!**

Malfunctions with pacemakers

This device does **not** exceed the permissible limits for electromagnetic fields. Maintain a minimum distance of 25 cm between the device and your pacemaker.

Inadequate distance from the read/write head can result in inhibitions, reprogramming, or incorrect stimulation pulses.

**Warning!**

Hot surfaces

Caution, risk of burns when handling the device! Allow the device to cool for at least half an hour after it has been switched off before you touch it.

The read/write head is intended for wall mounting or mounting on brackets in internal areas. Please mount the read/write head using only the holes provided in the housing. The preferred mounting direction is with the cable connection facing vertically downwards.

**Note!**

Do not lay the connection cable in the main beam direction of the antenna.

To attach the read/write head, use four screws with a diameter of 6 mm, as well as mounting materials that are suitable for the type of mounting surface. The tightening torque of the screws depends on the type of mounting.

**Caution!**

Mounting the read/write head

Make sure that the read/write head is firmly attached to the mounting surface.

**Note!**

The installation recommendations made in this document are based on favorable conditions. Pepperl+Fuchs GmbH provides no guarantee of correct function in cross environments.
4.3.1 Room Orientation

The alignment of the read/write tag antennae in relation to the antennae of the read/write head influences the detection range of the system. Make sure the antennae are aligned parallel to each other.
4.3.2 Minimum Distances

When positioning the read/write head, please observe the minimum distances. The lateral distance between the read/write head and metals or liquids should be at least 50 cm. The distance between the read/write head and the ground should be at least 50 cm.

Optimum alignment of the tag
- Good communication between the read/write head and tag

Poor alignment of the tag
- Insufficient communication between the read/write head and tag

Figure 4.2

1 Read/write head
2 Tag
During simultaneous operation of several read/write heads, only one read/write head may ever communicate with a tag at any given time. When arranging the read/write heads, make sure that the measurement ranges do not overlap. You can enlarge or reduce the size of the measurement range by changing the transmitting power. Determine the measurement range of each read/write head at the mounting location.

**Note!**

During mounting, take into account how the read/write heads may cause interference with each other. The further the transmission channels of the read/write heads are from each other, the lower the risk of interference.

If you want to transmit with just one read/write head at any given time, use the multiplex mode of the IDENTControl control interface. Multiplex operating mode allows chronologically exclusive access to tags, and prevents mutual interference from read/write heads. For a precise description, see the manual for your control interface.

### 4.3.3 Polarization

The polarization of the electromagnetic wave emitted by an antenna depends on the electromagnetic field component and the position of the antenna. Polarization can be either linear or circular. To achieve the maximum detection range for a UHF system, the polarization of the read/write head must match the polarization of the tag. Refer to the relevant data sheet to find the polarization of the tag.

- **Linear polarization:** When an electromagnetic wave has linear polarization, the direction of the vector of the electromagnetic field component is constant. Linear polarization can be either vertical or horizontal. This characteristic depends on the position of the antenna.

- **Circular polarization:** When an electromagnetic wave has circular polarization, the vector of the electromagnetic field component rotates around an axis parallel to the direction of emission. The rotation of the antenna around the transmission axis has no effect.

The integrated antenna of the IUH-F192-V1-* read/write head has dual linear polarization. The read/write head operates in combined mode by default. In combined mode, both horizontal and vertical polarization are used for each read/write access. This increases the reading reliability of tags with an unknown location in the room.

If the orientation of the tags is known, you can optimize the access time by setting a fixed polarization. To do this, you can switch the polarization to horizontally linear polarization or vertically linear polarization via the IDENTControl control interface software. The linear polarization plane refers to the preferred mounting direction with the cable connection mounted vertically downwards.

![Figure 4.3](image-url)  
**Figure 4.3**  
1 = Vertical polarization plane  
2 = Horizontal polarization plane
4.4 Connection

Connect the IUH-F190-V1-* read/write head to the IDENTControl control interface using a shielded cordset (see chapter 3.8.3). Ensure that the shield fully encapsulates the connection cable to avoid EMC interference. (see chapter 4.5)

Connect the IUT-F190-R4-V1-* read/write head to the higher level control unit using a shielded cordset. Ensure that the shield is fully encapsulating so that interference is dissipated via the protective earth connections to avoid EMC disturbances.

Warning!
Incorrect electrical connection
Damage to the device or plant caused by incorrect electrical connection.
Check all connections in the plant before commissioning the device.

After connecting the supply voltage, the POWER LED on the device lights up green. If the LED does not light up on the device, the power supply is not connected correctly.

4.5 EMC Concept

The outstanding noise immunity of the IDENTControl against emission and immission is based on its consistent shielding design, which uses the principle of the Faraday cage. Interference is caught in the shield and safely diverted via the ground connections.

The cable shielding is used to discharge electromagnetic interference. When shielding a cable, you must connect both sides of the shield to ground with low resistance and low inductance.

Note!
If cables with double shields are used, e.g. wire mesh and metalized foil, the both shields must be connected together, with low resistance, at the ends when making up the cable.
Power supply cables are the source of much interference, e.g. from the supply lines of 3-phase electric motors. For this reason, the parallel laying of power supply cables with data and signal cables should be avoided, particularly in the same cable duct.

Note!
The circuit ground is conductively connected to the housing of the write/read head and to the protective ground. (Connection image see Figure 3.5 on page 24)
5 Commissioning

5.1 Definitions

5.1.1 Display

Angle brackets contain the abbreviated meaning of a command structure, e.g., <Data>

The index \textsubscript{hex} or \textsubscript{xx} denotes a hexadecimal number.

\textsubscript{hex}ASCII denotes a value in the hexadecimal system, specified in ASCII characters.

Example: \(10_{\text{dec}}\) corresponds to \(A_{\text{hex}}\), \(A_{\text{ASCII}}\) corresponds to \(41_{\text{hex}}\).  see chapter 9.2

5.1.2 Legend

\begin{itemize}
  \item \textless ChanNo\textgreater : IDENT
  \item \textless CHCK\textgreater : 1 byte, 8-bit check sum with the addition of all preceding characters, without overflow
  \item \textless Data\textgreater : Data with the size \textless WordNum\textgreater multiplied by 4 bytes
  \item \textless DataLength\textgreater : Length of the data specified to a command, 2 characters binary, HighByte, LowByte
  \item eirp: equivalent isotropically radiated power
  \item erp: effective radiated power
  \item \textless ETX\textgreater : 1 byte = 03\textsubscript{hex}
  \item \textless read-only code\textgreater : TID, 4 bytes + an optional 4 or 8 bytes
  \item \textless Ldata\textgreater : Length of the data in bytes, 2 bytes
  \item Use in multiframe protocol
  \item \textless Length\textgreater : 1 character \textsubscript{hex}ASCII = number of data bytes
  \item Permitted values in the read/write head IUH*: 2, 4, 6, 8, A, C, E
  \item \textless Luii\textgreater : Length of the UII in bytes, 2 bytes
  \item Use in multiframe protocol
  \item \textless LogicalOperation\textgreater : Links several filters; OR = 0; AND = 1
  \item If one filter only is used, this value is ignored
  \item \textless MaskData\textgreater : Mask specification
  \item \textless MaskLength\textgreater : Mask length in bits, values: 00...FF
  \item \textless MemBank\textgreater : Number of the memory bank (see parameter MB)
  \item \textless ParamTyp\textgreater : Parameter type, 2 bytes, or 2 ASCII characters
  \item \textless Negate\textgreater : Negates the mask comparison; not negated = 0; negated = 1
  \item \textless PC\textgreater : Protocol control word according to EPC Gen 2 (ISO/IEC 18000-63), 2 bytes, describes characteristics such as the length of the UI/EPC
  \item \textless SpecialFixcode\textgreater : \textless PC\textgreater & \textless UII/EPC\textgreater
  \item \textless Status\textgreater : 1 ASCII character (see chapter 6.7)
  \item \textless StartAddress\textgreater : Start address in the selected memory bank in bits, values: 0000...FFFF
  \item \textless SystemCode\textgreater : = U (for read/write head IUH*)
  \item \textless TagType\textgreater : 2 ASCII characters
  \item \textless UII/EPC\textgreater : Unique Item Identifier, memory area of a tag in accordance with EPC Gen 2 (ISO/IEC 18000-63), in which the EPC code is stored
\end{itemize}
5.2 Initial Commissioning

**Note!**

**Transmission License**

A country-specific transmission license is required to operate the read/write head. In the European Union and Turkey, the manufacturer's EU declaration of conformity constitutes an adequate license. A currently valid transmission license may not exist for all countries of use listed in this chapter, as transmission licenses are temporary in some countries. All currently valid transmission licenses can be found in the data sheet for the respective read/write head at www.pepperl-fuchs.com.

**Warning!**

Malfunctions with pacemakers

This device does **not** exceed the permissible limits for electromagnetic fields. Maintain a minimum distance of 30 cm between the device and your pacemaker.

Inadequate distance from the read/write head can result in inhibitions, reprogramming, or incorrect stimulation pulses.

All IUH-F192-V1-* read/write heads operate within their maximum frequency range from 865 MHz to 868 MHz, or from 902 MHz to 928 MHz, with the appropriate settings for the relevant country. This enables the following parameters to be set according to the applicable regulations for the relevant country:

- The maximum occupied bandwidth
- The channel bandwidth
- The channel plan used
- The frequency access method
- The maximum power setting

**Note!**

**Country Identifier**

The IUH-F192-V1-FR* read/write head has no valid country identifier by default. This status is indicated by the flashing green LED. In this state, the read/write head will accept only the command for setting the relevant country identifier. Once you have parameterized a valid country identifier, you can begin using the read/write head.

The IUH-F192-V1-FR2-02 is supplied ex-works with the country identifier "02" for the USA, Canada, and Mexico. Due to legal regulations, you cannot change this country identifier in the IUH-F192-V1-FR2-02.

**Note!**

The country identifier set is saved in the read/write head as non-volatile. The country identifier setting is not affected by a reset to the factory settings. It can be overwritten with another valid country identifier at any time.

For technical details regarding the regional settings, see chapter 3.3. For an example of reading and writing the country identifier, see chapter 5.3.
5.3 Sensor Settings

**Warning!**
Device not configured or configured incorrectly

Configure the device prior to commissioning. A device that has not been configured or configured incorrectly may lead to faults in the plant.

**Warning!**
L'appareil non configuré ou mal configuré

Configurez l'appareil avant de l'utiliser. Un périphérique mal configuré peut provoquer des erreurs dans le système.

You must configure the control interface before commissioning the IUH-F190-V1-* read/write head. To do so, refer to the "Commissioning" chapter of the manual for your control interface.

Configure the read/write heads with the described system commands (). For a parameterization example, see see chapter 5.4.

**Caution!**
Uncontrolled triggered processes

Before commissioning the device, make sure that all processes are running smoothly; otherwise damage may occur in the plant.

**Caution!**
Processus déclenchés incontrôlés

Avant la mise en service de l'appareil, assurez-vous que tous les processus fonctionnent de manière contrôlée, sinon vous risquez d'endommager le système.

5.4 Operation via the Command Interface

This section shows you how to commission the IUH-F190-V1-* read/write head using an IDENTControl control interface with serial interface. The commissioning procedure described relates to the RS-232 interface and involves a PC. The examples include the syntax for coding the commands and parameters via the Ethernet TCP/IP and PROFIBUS/PROFINET interfaces. Further details about these codes and the factory settings for your IDENTControl control interface can be found in the corresponding manual.

The commissioning of the IUT-F190-R4-V1-* read/write head with integrated RS-485 interface is also carried out using the above commands and parameters. For details regarding the IUT F190-R4-V1-* read/write head

**Example:**

In the examples below, the read/write head is connected to channel 1 of the control interface.

The outputs follow the multiframe protocol, see table "Responses Depending on Protocol Mode QV" on page 61.

<td>.BF.03.00.36</td>
</tr>
</tbody>
</table>
6 Operation

6.1 General

The sections below contain information about the commands that relate to your read/write head. The commands are described using the example of an IDENTControl control interface with serial interface. All other generally applicable commands and error messages or status messages can be found in the manual for your IDENTControl control interface.

Commissioning of the IUT-F190-R4-V1-* read/write head with integrated RS-485 interface is also carried out using the commands and parameters described. For details regarding the IUT F190-R4-V1-* read/write head

6.2 Basic Command Process

Interference Due to Multipath Propagation

The electromagnetic waves radiated by the read/write head do not just follow the direct route to the tag, but are also reflected off objects in the vicinity, meaning that multiple partial waves overlap with the waves radiated by the read/write head.

This overlap causes interference (i.e., exaggeration and dampening of the reception field strength), leading to almost complete degradation. Depending on the environment, several reflections may occur with differing intensity and distance. These different reflections lead to a field strength in the measurement range that is difficult to predict. In the areas of degradation, the prevailing field strength is weaker than the minimum detection field strength of the tag. As a result, the tag cannot be activated for communication. Exaggeration of the field strength may lead to unwanted excessive detection ranges.

1. Detection range
2. Degradation
3. Excessive detection ranges
The reflections and the resulting spatial inhomogeneity of the field strength depend on the frequency used. The absolute value of the field strength depends on the transmission power. Since the tags move in the measurement range of the read/write head, and the environment can change, it is advisable to repeat the commands at different transmission frequencies and at varying power. Different transmission frequencies are advisable, since the manufacturing tolerances and the immediate environment of the tag have an effect on the tag's resonance frequency.

**Several Tags in the Measurement Range**

Each read or write command can access one, several, or all tags in a measurement range. The process is controlled by filter masks, which are managed via the commands Set Filter Mask (FI) and Activate/Deactivate Filter (MF). These commands allow you to detect specific tags in the measurement range. see chapter 6.5.

**Read Algorithm**

To communicate with tags with the maximum possible probability, the read/write head uses an algorithm that varies the transmitting power and frequency. You can set the corresponding values for this algorithm via the parameters Power Transmit (PT), Channel Frequency (CD), or Number of Channels (NC) for the frequency hopping spread spectrum, and Number of Attempts (TA). The number of set attempts is executed for each pairing of power and frequency. This process takes a long time, but leads to a high read/write rate. The algorithm runs through all combinations because it may be the case that a tag can be detected only by one specific combination of power and frequency. This applies when the read/write head uses a programmable frequency list as the frequency access method. This frequency list is defined by parameter CD.

If the country identifier specifies a frequency hopping spread spectrum, the channels defined there are used. This is not influenced by the programmable frequency list. You can adjust the number of channels used for each attempt via the Number of Channels parameter (NC).

With the parameter Search Algorithm Cancellation Criteria (NT), you can specify the number of tags to be processed. If you know the number of tags in the measurement range, you can use this total number as the value for parameter NT. If the number of tags found corresponds to or exceeds the value defined in parameter NT, the algorithm cancels any further runs to save time.

*Tip*
If analysis of a specific application shows that a particular frequency and transmission power are sufficient to execute commands successfully, the parameters can be set accordingly, subject to national legislation. This measure reduces the processing time.

### 6.3 Command Overview

The commands in the list are described in detail on the following pages.

The following uses the command syntax for the IUH-F190-V1-* read/write heads with IDENTControl serial control interface. The channel number <ChanNo> is always included in the commands. The command syntax is identical to the syntax of the IUT-F190-R4-V1-* read/write heads with integrated RS-485 interface, except for the channel number. For the IUT-F190-R4-V1-* read/write heads, the channel number <ChanNo> is not included in single-drop mode. In multi-drop mode, the channel number <ChanNo> is replaced by the device address <DeviceNo>.

</table>
6.4 Read/Write Commands

The tag's memory structure is based on the following read/write commands in accordance with EPC Gen 2 (ISO/IEC 18000-63). See chapter 3.2.3.

**Single Read Read-Only Code SF**

One attempt is made to read a read-only code (TID). The read-only code is 4, 8, or 12 bytes long, and comprises a 4-byte part number, which denotes the tag type, and optionally a tag with a unique serial number of 4 or 8 bytes. Details see chapter 3.2.3.

**Enhanced Read Read-Only Code EF**

This command continuously attempts to read a read-only code (TID). If a read-only code is read, this is reported once. If there is no tag in the detection range, or if the tag leaves the detection range, a status 5 message is reported.

### Command Examples

**SF1 reads the read-only code to IDENTControl channel 1.**

**Enhanced Read Read-Only Code EF**

This command continuously attempts to read a read-only code (TID). If a read-only code is read, this is reported once. If there is no tag in the detection range, or if the tag leaves the detection range, a status 5 message is reported.
Example:

EF1 continuously reads the read-only code to IDENTControl Channel 1

**Single Read Special Read-Only Code SS**

This command reads the UII segment from tags according to EPC Gen2 (ISO/IEC 18000-63).

**Command:**

SS <ChanNo> 0 <CHCK> <ETX>

**Response:**

<Status> <ChanNo> <Length>

<SpecialFixcode> <CHCK> <ETX>

F <ChanNo> 0001 <CHCK> <ETX>

Example:

SS10 reads the entire UII segment.

The tag type determines the maximum length of the UII/EPC. The actual length of the UII/EPC is defined via the protocol control word <PC>. The data is structured as follows:

<Length> = Length of the <SpecialFixcode> in ASCII

<SpecialFixcode> = <PC> & <UII/EPC>

<PC> corresponds to the protocol control word in accordance with EPC Gen 2 (ISO/IEC 18000-63), 2 bytes long.

<UII/EPC> contains the usage data.

**Note!**

**UII/EPC**

If there are multiple tags in the measurement range with the same UII/EPC, the identical tags are reported with Status A.

**Enhanced Read Special Read-Only Code ES**

This command continuously attempts to read the UII segment from tags according to EPC Gen 2 (ISO/IEC 18000-63). If the <SpecialFixcode> of a tag is read, this is reported once. If there is no tag in the detection range, or if the tag leaves the measurement range, a status 5 is reported.

**Command:**

ES <ChanNo> 0 <CHCK> <ETX>

**Response:**

<Status> <ChanNo> <Length>

<SpecialFixcode> <CHCK> <ETX>

Example:

ES10 continuously reads the UII segment.

The tag type determines the maximum length of the UII/EPC. The actual length of the UII/EPC is defined via the protocol control word <PC>. The data is structured as follows:

<Length> = Length of the <SpecialFixcode> in ASCII

<SpecialFixcode> = <PC> & <UII/EPC>

<PC> corresponds to the protocol control word in accordance with EPC Gen 2 (ISO/IEC 18000-63), 2 bytes long.

<UII/EPC> contains the usage data.
**Single Write Special Read-Only Code SP**

This command writes a `<Length>` octet long UII/EPC code to tags according to EPC Gen 2 (ISO/IEC 18000-63).

Command: SP <ChanNo> <Length> <SpecialFixcode> <CHCK> <ETX>

Response: <Status> <ChanNo> <NUL> <Length> <SpecialFixcode> <CHCK> <ETX> F <ChanNo> 0001 <CHCK> <ETX>

The data length `<Length>` must be a whole number multiple of 2 octets because in accordance with EPC Gen 2 (ISO/IEC 18000-63), `<UII/EPC>` must be written in 16-bit words. Only the lengths $2^{1}_{dec}$, $4_{dec}$, ... $14_{dec} (= 2_{ASCII}, 4_{ASCII}, ..., E_{ASCII})$ are permissible. The length is shown in hexadecimal format, and includes the length of PC and UII/EPC. If a UII/EPC of 96 bits is written, this results in $2 + 12 = 14$ octets $= E_{ASCII}$ octet.

$<Length> = \text{Length of the } <\text{SpecialFixcode}> \text{ in } \text{ASCII}_{\text{hex}}$

$<\text{SpecialFixcode}> = <\text{PC}> \& <\text{UII/EPC}>$

$<\text{PC}>$ corresponds to the protocol control word in accordance with EPC Gen 2 (ISO/IEC 18000-63), 2 octets long.

$<\text{UII/EPC}>$ contains the usage data.

Example:

SP1E.30.00.30.14.F7.33.7C.00.1F.00.00.03.1C.6E writes the value ".30.00" for $<\text{PC}>$, and the UII/EPC code ".30.14.F7.33.7C.00.1F.00.00.03.1C.6E" with a length of $2 + 12$ octets $= 14$ octets to IDENTControl/channel 1.

When using this command, make sure that the protocol control word contains the correct length of the following UII/EPC. If this is not executed correctly, the complete data is not output on the subsequent read operation because the command SS uses the length in the protocol control word for the output.

In accordance with EPC Gen 2 (ISO/IEC 18000-63), the protocol control word consists of two octets. The five highest value bits denote the length of the $<\text{UII/EPC}>$ in words ($= 16$ bit):

- $00000_{bin}$: No word $0$ bits
- $00001_{bin}$: One word $16$ bits
- $00010_{bin}$: Two words $32$ bits
- ...
- $11111_{bin}$: 31 words $496$ bits

The meaning of the remaining bits is described in EPC Gen 2 (ISO/IEC 18000-63). If a UII/EPC has the length 12 octets, i.e., 6 words ($001100_{bin}$), and all other bits are equal to 0, the protocol control word corresponds to $0011000000000000_{bin}$ or $3000_{hex}$. If some of the other bits are not equal to 0, this produces a different protocol control word.

**Note!**

**Several Tags in the Measurement Range**

If there is more than one tag in the measurement range when this command is run, the UII is written to the first tag only. Status A is output for all other tags.
Single Read Words SR
One attempt is made to read <WordNum> 32-bit words from address <WordAddr>.

Command:  
SR <ChanNo> <WordAddr> <WordNum>  
<CHCK> <ETX>

Response:  
<Status><ChanNo><Luii><UII><Ldata><Data>  
<CHCK> <ETX>
F <ChanNo> 0001 <CHCK> <ETX>

Example:
SR1000101 reads a 4-byte word from memory address "0001".

Note!
The memory bank (MB) parameter defines the bank accessed by this command. see "Memory Module for Tag Accesses to the *Memory Bank" MB* on page 58.

Enhanced Read Words ER
Continuous attempts are made to read <WordNum> 32-bit words from the address <WordAddr>. Only changing data is transferred via the interface. When a read/write tag leaves the read range, status 5 is output.

Command:  
ER <ChanNo> <WordAddr> <WordNum>  
<CHCK> <ETX>

Response:
<Status><ChanNo><Luii><UII><Ldata><Data>  
<CHCK> <ETX>

Example:
ER1000101 continuously reads a 4-byte word from memory address "0001".

Note!
The memory bank (MB) parameter defines the bank accessed by this command. see "Memory Module for Tag Accesses to the *Memory Bank" MB* on page 58.

Single Write Words SW
One attempt is made to write <WordNum> 32-bit words from the address <WordAddr>.

Command:  
SW <ChanNo> <WordAddr> <WordNum>  
<Data> <CHCK> <ETX>

Response:  
<Status><ChanNo><Luii><UII><CHCK>  
<ETX>
F <ChanNo> 0001 <CHCK> <ETX>

Example:
SW1000101ABCD writes the 4-byte-long word "ABCD" from memory address "0001".

Note!
The memory bank (MB) parameter defines the bank accessed by this command. see "Memory Module for Tag Accesses to the *Memory Bank" MB* on page 58.
**Note!**
When writing to the UI/EPC area (MB = 1), note that it is not possible to write to the CRC. The first writable address is 0x0001. The protocol control word <PC> begins at this address. Use the command #SW.

**Enhanced Write Words EW**
This command continuously attempts to write <WordNum> 32-bit words from the address <WordAddr>. If the command was executed successfully, a status 0 is reported. If there is no tag in the detection range, or if the tag leaves the detection range, a status 5 is reported.

Command:

```
EW <ChanNo> <WordAddr> <WordNum> <Data> <CHCK> <ETX>
```

Response:

```
<Status> <ChanNo> <Luii> <UII> <CHCK> <ETX>
```

Example:

EW1000101ABCD continuously writes the 4-byte long word "ABCD" from memory address "0001".

**Note!**
The memory bank (MB) parameter defines the bank accessed by this command. see "Memory Module for Tag Accesses to the "Memory Bank" MB" on page 58.

**Note!**

16-Bit Read/Write Commands
The read/write commands SR, ER, SW, and EW are interpreted as 16-bit versions by means of a preceding # symbol.

The 16-bit read/write commands behave in the same way as the 32-bit versions.
- 16-bit commands write or read a word with a length of 2 bytes.
- 32-bit commands write or read a word with a length of 4 bytes.

Example:

#SW1000202ABCD corresponds to SW1000101ABCD

**Kill UHF Tag KI**
This command sets a UHF tag to a state where no further access is possible. The command can be executed only if a valid password has previously been set in segment Bank 00 via the command SW. See chapter 3.2.3. The password must have at least 1 non-zero bit.

Command:

```
KI <ChanNo>.30.30 <UIILength> <UIIData>
```

Response:

```
<Status> <ChanNo> <Luii> <UII> <CHCK> <ETX>
F <ChanNo> 0001 <CHCK> <ETX>
```

- `<UIILength>` = Mask length for the UII/EPC in bits, values: 00 ... FF, always begins at Address 0. The information is entered as 2 hexASCII characters.
- `<UIIData>` = Specification of the mask for the UII, in octets
- `<PassWord>` = Password for killing a UHF tag, 4 octets
- `<RecomBits>` = Recommission bits, always set to zero
6.5 Filter Commands

Each read or write command can access one, several, or all tags in a measurement range. The process is controlled by filter masks, which are managed via the commands Set Filter Mask (FI) and Activate/Deactivate Filter (MF). These commands allow you to detect specific tags in the measurement range. See chapter 6.5.

Set Filter Mask FI

Using command FI, you can define a filter mask for accessing the tags located in the box. You can define up to 3 filters (0-2). The following syntax is used:

Command: FI <ChanNo> <FilterNumber> <MemBank> <Negate> <LogicalOperation> <StartAddress> <MaskLength> <MaskData> <CHK> <ETX>

Response: <Status> <ChanNo> <CHK> <ETX>

例: There are three tags in the measurement range of the read/write head. Each tag has a unique identifier of <PC> & <UII/EPC>:

1. Tag .34.00.E2.00.92.01.20.51.70.00.00.00.02.76
2. Tag .34.00.E2.00.92.01.20.51.70.00.00.00.02.66
3. Tag .34.00.E2.00.90.51.33.02.00.92.18.20.56.15

If you want to detect the 3rd tag, the filter mask is: FI101000001028.34.00.E2.00.90

Meaning of Bits

| Command  | FI       | 1 | Channel 1
|----------|----------|---|----------------
| <ChanNo> |          |   | First filter used, filter number = 0
| <FilterNumber> | 0 | Memory bank 01; should be filtered to UII/EPC
| <MemBank> | 1       |   | 
| <Negate> | 0       | 0 | Not negated
| <LogicalOperation> | 0 | OR link not relevant here because only one filter is set
| <StartAddress> | 0010 | Value is always 0
|                      | 0 |

Example:

KI10018.E2.00.90abcd.00 kills a UHF tag with a UII starting "E2.00.90" and using the password "abcd."
Owing to the structure of the memory bank for UII/EPC (see image on page 12), the start address is located at bit 16. The CRC-16 value occupies the memory position from bit 0 through bit 15; the PC starts at bit 16.

If you activate the filter with the command MF, and then execute command SS10, you receive only one response from the corresponding tag even if other tags are located in the measurement range:

```
.34.00.E2.00.90.51.33.02.00.92.18.20.56.15
```

The value <Negate> controls the mask comparison. 0 = not negated, 1 = negated. If you negate the filtering by setting the value <Negate> in the command FI101100001028.34.00.E2.00.90, you receive a response from the tags that does not match the filter:

```
.34.00.E2.00.92.01.20.51.70.00.00.00.02.76
.34.00.E2.00.92.01.20.51.70.00.00.00.02.66
```

If you prefer to filter only at the start of <UII/EPC>, and ignore the <PC>, send the command FI101000002018.E2.00.90. The start address is 20\text{hex}, the mask length has 24 bits, and the mask is .E2.00.90.

The value <LogicalOperation> logically links several filters with each other and is evaluated only if more than one filter is used. If only one filter is used, this value is ignored. 0 = OR, 1 = AND

Other examples include:

- FI102000000018.E2.00.10 sets filter 0 so that all tags with a TID beginning with .E2.00.10 are detected.
- FI111100002008.22 sets filter 1 so that all tags whose UII/EPC do not begin .22 are detected.
- FI101010001070.00123456789012 sets filter 0 so that the tag with the SpecialFixcode (PC+UII/EPC) 0.00123456789012 is detected.

The letter x can be used as a wildcard for the channel and filter number. Command FIxx00000000 resets the three filters for all IDENTControl channels.

### Activate/Deactivate Filter MF

Command MF activates or deactivates the filter masks.

**Command:** MF<ChanNo><Value><CHCK><ETX>

**Response:** <Status><ChanNo><CHCK><ETX>

The following values are possible:

- 0 = Deactivate filter masks
- 1 = Activate filter masks - mode 1
- 2 = Activate filter masks - mode 2

**Example:**

MF11 activates the filter masks for IDENTControl channel 1
Command MF - Mode 1

In total, there are 15 tags in the measurement range of the read/write head, with three groups of five marked as either A, B, or C. The filter is now set to "B" by the command FI.

If you execute command MF11 (Activate Filter - Mode 1), this command affects all subsequent commands.

If a write command is executed next, all "B" tags in the measurement range are selected and are assigned a 'Selected' flag. The write command is executed only for tags with a Selected flag.

When the filter is set to "B", command MF11 (Filter Activated - Mode 1) selects all "B" tags; the following commands address the selected "B" tags.

1. Read/write head
2. Tags "A", "B", "C"
3. Filter mask
4. Selected flag

Command MF - Mode 2

In total, there are 15 tags in the measurement range of the read/write head, with three groups of five marked as either A, B, or C. The filter is set to "B" by command FI.

If you execute command MF12 (Activate Filter - Mode 2), this command affects all subsequent commands.

If a write command is executed next, all tags in the measurement range that are not "B" tags are selected. These tags are assigned a 'Selected' flag. The write command is executed only for tags with no Selected flag.
When the filter is set to "B," command MF12 (Filter Activated - Mode 2) selects all "A" and "C" tags, and the following commands address the unselected "B" tags.

**Difference Between Command MF - Mode 1 and Command MF - Mode 2**

In both cases, the subsequent commands are applied only to the "B" tags in the measurement range.

With MF11, "B" tags are assigned a Selected flag. With MF12, "B" tags are not assigned a Selected flag.

If a "D" tag with a Selected flag from the operation of a different read/write head enters the measurement range, this "D" tag will execute the subsequent commands if MF11 is activated. If MF12 is activated, this "D" tag will not execute the subsequent commands.

### 6.6 Configuration Commands

The response to a configuration command is a status message from the read/write head. During the read operation, a status message and the corresponding data are received as the response.

#### 6.6.1 ChangeTag Command

This command tells the R/W system with which tag type to communicate.

**Command:**

```
CT <ChanNo> <TagType> <CHCK> <ETX>
```

**Response:**

```
<Status> <ChanNo> <CHCK> <ETX>
```

**Default:**

80

**Example:**

CT180 sets the tag type for IDENTControl channel 1 to IUC80

CT180 sets a generally valid tag type, which allows the read-only code to be read out for each tag, and therefore provides information about the chip type of the tag.
The read/write head uses only tag type 80.

### Tag Types, UHF

<table>
<thead>
<tr>
<th>Tag type</th>
<th>Chip Type</th>

<td>Readable/writeable for RC = 2, 3, 7, 9, 10, 11, 12, 13, 14</td>
</tr>
<tr>
<td></td>
<td>Readable for RC = 1, 4, 5, 6, 8</td>
<td></td>
</tr>
</tbody>
</table>
The parameters are saved in the read/write head as nonvolatile.

### Read Parameters

The RP command reads configuration parameters from the read/write head.

**Command:**

```
RP <ChanNo> <SystemCode> <ParamTyp> <DataLength> <Data> <CHCK> <ETX>
```

**Response:**

```
<Status> <ChanNo> <Data> <CHCK> <ETX>
```

- `<SystemCode>` = U\_ASCII for IUH-\*^1
- `<ParamTyp>` = 2 bytes ASCII
- `<DataLength>` = Length of `<Data>` in command, 2 bytes binary
- `<Data>` = Optional additional information

**Example:**

RP1UE5.00.00 outputs the number of unsuccessful read attempts until status 5.

### Write Parameters

Command WP writes configuration parameters to the read/write head.

**Command:**

```
WP <ChanNo> <SystemCode> <ParamTyp> <DataLength> <Data> <CHCK> <ETX>
```

**Response:**

```
<Status> <ChanNo> <CHCK> <ETX>
```

- `<SystemCode>` = U\_ASCII for IUH-\*^1
- `<ParamTyp>` = 2 bytes ASCII
- `<DataLength>` = Length of `<Data>`, 2 bytes binary
- `<Data>` = Optional additional information

**Example:**

WP1UE5.00.01.05 sets the number of unsuccessful read attempts to status 5 on 5 attempts.
6.6.3 Parameters

**Antenna Polarization AP**

This parameter switches polarization to horizontally linear, vertically linear, or combined mode, or reads out the polarization currently set.

- **ParamTyp**: AP
- **Default**: AP = C
- **Value range**:
  - C = combined
  - H = Horizontally linear
  - V = Vertically linear

1. Combined horizontally linear and vertically linear for each read/write attempt

**Example:**
- WP1UAP00.01H switches the polarization to horizontally linear
- WP1UAP00.01C switches the polarization to combined mode
- RP1UAP00.00 reads out the set polarization

Set the polarization to combined mode if the tag’s orientation is not known. In combined mode, horizontal polarization and then vertical polarization is used for each read/write attempt. This achieves the same results as when circular polarization is used. The duration of the read/write operation is extended in combined mode.

**CD Transmission Channels**

**Programmable frequency list** frequency access method:

This parameter sets the number and sequence of transmission channels or reads out the number and sequence of transmission channels.

**Frequency hopping spread spectrum** frequency access method:

This parameter reads out the number and sequence of transmission channels for the frequency hopping spread spectrum.

- **ParamTyp**: CD
- **Default**: Depends on the country identifier set, see chapter 3.3.
- **Value range**: Depends on the country identifier set, see chapter 3.3.

**Example:**
- WP1UCD.00.04.07.0A.04.0D defines the sequence 7, 10, 4, and 13 as the permitted transmission channels
- WP1UCD.00.01.0A allows the read/write head to use only transmission channel 10
- RP1UCD.00.00 reads out the sequence of permitted transmission channels

**Tip**

If you have parameterized several transmission channels with the parameter CD, the read/write head executes each write or read command on all defined transmission channels sequentially according to the defined sequence. If several additional transmission power values are parameterized (), all set transmission powers are executed on each transmission channel for each read or write command. See chapter 6.2.
**Number of Unsuccessful Attempts until Status 5 "Enhanced Status 5" E5**

This parameter sets the number of unsuccessful read/write attempts until a status 5 is output for an enhanced command, or outputs the number. Status 0 and status A depend on this parameter, and are output immediately.

ParamTyp: E5  
Default: E5 = 5  
Value range: 0 ... 252

Example:
WP1UE5.00.01.05 sets the number to 5 unsuccessful read/write attempts until a status 5 is output  
RP1UE5.00.00 outputs the number

If the number of read/write attempts is reduced:

- Faster response time in enhanced mode.  
- Status 5 messages in the event of unstable tag reading.

**Read Out Filter Mask "Filter List" FL**

Parameter FL contains the current configuration of the filter masks as set during execution of command FI. The output format corresponds to the data input format of command FI without the filter number. The parameter can only be read, but not set.

ParamTyp: FL  
Value range: 0 ... 2

Example:
RP1UFL.00.01.02 outputs the current configuration of filter 2

Response: <Status><ChanNo><MemBank><Negate><LogicalOperation>0<StartAddress><MaskLength><MaskData><CHCK><ETX>

**Output Additional Information, "Information" IF**

Parameter IF allows you to output additional information providing that the reading was successful and the multiframe protocol is activated. See "Protocol Mode QV" on page 60. The additional information is the RSSI value of the reading, the transmission channel used, and transmitting power of this reading.

ParamTyp: IF  
Default: IF = 0  
Value range: 0, 1

Example:
WP1UIF.00.01.01 prompts the read/write head to output additional information after each successful reading.  
RP1UIF.00.00 outputs the value of parameter IF.

The additional information is output in the following format:  
B<ChanNo> <InfoTyp> <RSSI> <TxChannel> <TxPower>
To distinguish the additional information from the standard outputs, the output begins with the status B as the first ASCII character, followed by the IDENTControl channel. This is followed by the <InfoTyp>, which indicates that this is a type .01 information frame. The output ends with the RSSI value (1 byte), the transmission channel used (1 byte), and the power used (2 bytes). The RSSI value is between 0 (= low) and 100 (= high).

**Meaning of the bytes in response .42.31.01.1A.0D.00.14**

- **.42** = Status BASCII to identify the additional information
- **.31** = 1ASCII, IDENTControl/channel 1
- **.01** = The information type
- **.1A** = 26dec, RSSI value
- **.0D** = 13dec, tag access to transmission channel 13
- **.00.14** = 20dec, transmission power 20 mW

**Memory Module for Tag Accesses to the "Memory Bank" MB**

This parameter specifies the bank accessed by the read/write commands SR, ER, SW, and EW. See chapter 3.2.3.

- **ParamTyp:** MB
- **Default:** MB = .03 = User Memory
- **Value range:** .00 = reserved (password area)
  - .01 = UII/EPC
  - .02 = TID
  - .03 = User Memory

**Example:**

WP1UMB.00.01.03 sets the bank to User Memory

**Retrieve Additional Information MD**

This parameter allows you to retrieve information about the last successful tag access. This returns the RSSI value with a length of 1 byte, the transmission channel used with a length of 1 byte, and the transmitting power with a length of 2 bytes. The RSSI value may be between 0 (= low) and 100 (= high).

Parameter MD allows the same data to be accessed in the single-frame protocol as is available in the multiframe protocol with parameter IF. See "Protocol Mode QV" on page 60 and see "Output Additional Information, "Information" IF" on page 57.

- **ParamTyp:** MD

**Example:**

RP1UMD.00.01.01 returns the response .30.01.13.04.00.32

**Explanation of the response:**

- **<Status>** = 0
- **<ChanNo>** = 1
- **<RSSI>** = .13 = 19dec
- **<TXChannel>** = .04
- **<TXPower>** = .00.32 = 50dec mW
Measurement of Reflected Transmitting Power "Measure Reflection" MF

This parameter measures the reflected transmitting power of the antenna and the environment. The results are output as one byte per transmission channel. The transmission channels are dependent on the country-specific settings.

The parameter is not output for the "combined" antenna polarization.

To obtain the reflected power in dBm, subtract the value 100 from the return value in decimal notation.

ParamTyp: MF
Value range: -18 .. +21 dBm

1.0 or 255 is returned for values outside the value range

Example:
If the country identifier RC = 01 (= 4 channels), RP1UMF.00.00 returns the response 01.63.64.67.65

Explanation of the response:
<Status> = 0
<ChanNo> = 1
<PCh04> = .63 = 99 dec results in 99 - 100 = -1 dBm
<PCh07> = .64 = 100 dec results in 100 - 100 = 0 dBm
<PCh10> = .67 = 103 dec results in 103 - 100 = +3 dBm
<PCh13> = .65 = 101 dec results in 101 - 100 = +1 dBm

Number of Channels NC

Frequency Access Method Frequency hopping spread spectrum:
Parameter NC indicates the number of channels on which a write or read attempt is performed. If the value 4 is set, the read/write head attempts to read the tag on 4 different frequencies when a read command is given. The parameter can be read and written.

Frequency Access Method Parameterizable frequency list:
The parameter can be read only. The parameter specifies the number of transmission channels that are set with parameter CD.

ParamTyp: NC
Default: NC = 4
Value range: 1 .. 50

Example:
WP1UNC.00.01.02 allows two channels for a read attempt.
RP1UNC.00.00 reads out the number of channels set.
Search Algorithm Cancellation Criteria "number of tags to find" NT

Parameter NT specifies the number of tags in the measurement range that the read/write head searches for. Each command is repeated in accordance with the parameters Transmission Power (PT), Transmission Channel (CD) or Number of Channels (NC), and Number of Attempts (TA) (see chapter 6.2). If the number of tags found during the repeat operations reaches or exceeds the NT value, all further runs are canceled. The command is canceled, and the data is output.

If the number of tags is set to 255 (= .FF), the function is deactivated. This parameter does not affect "enhanced" commands, but only "single" commands.

ParamTyp: NT
Default: NT = 255
Value range: 0 ... 254, 255 = off

Example:
The value WP1UNT.00.01.05 sets the number of tags in the measurement range for which the read/write head searches to 5.

RP1UNT.00.00 outputs the set value.

Transmission Power "Power Transmit" PT

This parameter sets the transmission power in mW or reads out the transmission power set.

ParamTyp: PT
Default: Depends on the country identifier set, see chapter 3.3.
Value range: Depends on the country identifier set, see chapter 3.3.

Example:
WP1UPT.00.02.00.32 sets the transmission power to 50 mW
RP1UPT.00.00 reads out the transmission power currently set

Higher detection range if you increase the transmission power.
Possible excessive detection ranges if you increase the transmission power.
Lower detection range in reflective environments if you increase the transmission power.
Adjacent read/write heads might be affected due to increased detection range.

Note!
You can operate the IUH-F192-V1-* read/write head only with internally specified transmission power. You can use the command WP1UPT.00.02.xx.xx in the software to enter any transmission power within the specified range of values. The read/write head automatically sets the transmission power to the next lowest value available. Any entries outside the specified value range are returned as errors. Command RP1UPT.00.00 allows you to read out the power value that is currently set.
**Tip**
You can parameterize the read/write head with several transmission power values:
Command WP1UPT.00.06.00.14.00.32.00.64 sets three transmission power values for 20 mW, 50 mW, and 100 mW. Each read and write command is executed in succession for all three transmission power values. If one or more tags are found and successfully read/written for the first transmission power, the command is still executed with all other transmission powers to reach any other tags that may be available.

You can specify a maximum of ten transmission power values. If several additional transmission channels are selected (,), all set powers are executed on each transmission channel for each read or write command. See chapter 6.2.

**Protocol Mode QV**

Parameter QV toggles the output protocol between single frame and multiframe.

In single-frame protocol, the output corresponds to the Pepperl+Fuchs standard in LF and HF systems. If there is more than one tag in the measurement range, status A is output as a warning.

In the multiframe protocol, each tag that responded is output. An output is then issued which begins with status F, contains the number of responses, and completes the full command output.

**Example:**
WP1UQV.00.01.4D sets the protocol to multiframe.
RP1UQV.00.00 outputs the set protocol mode.

If QV = M, the following responses are made to a single read command (SR):

**Response:**

```
0<ChanNo><Luii><UII1><Ldata><data><CHCK><ETX>
0<ChanNo><Luii><UII2><Ldata><data><CHCK><ETX>
0<ChanNo><Luii><UII3><Ldata><data><CHCK><ETX>
F<ChanNo>0003<CHCK><ETX>
```

One read command was executed to which three tags responded. For each tag, the status, the IDENTControl channel, the length of the UII, the UII, the length of the data, and the read data are output. Then an output is issued with status F, the IDENTControl channel, and the number of tags that responded.

- `<Luii>` = Length of `<UII>` in bytes, 2 bytes
- `<Ldata>` = Length of `<data>` in bytes, 2 bytes

Table 6.2 <CHCK><ETX> omitted at the end of each response due to space requirements

### Q Value QW

In accordance with EPC Gen 2 (ISO/IEC 18000-63), the slotted ALOHA principle is used for anticollision. The number of time slots is defined as \(2^Q\). The parameter QW defines the Q value. As a guide, the number of expected tags in the measurement range.

- **ParamTyp:** QW
- **Default:** QW = 2
- **Value range:** 0 ... 7
Example:
WP1UQW.00.01.04 sets the Q value to 4. The read/write head therefore works with $2^4 = 16$ time slots.

RP1UQW.00.00 outputs the set Q value.

**Country Identifier, "Region Code" RC**

Parameter RC sets a country identifier or reads out the current country identifier.

The country identifier consists of two bytes:

- 1. Byte = 00
  - You can change the country identifier
- 1. Byte = 80
  - You cannot change the country identifier

The country identifier can be set to write-protected by the manufacturer only. The first byte is then set to 80. The second byte defines the country identifier. For all the available country identifiers, see chapter 5.2, and for the corresponding technical details, see chapter 3.3.

### ParamTyp: RC

**Default setting:** .00.00 (green LED flashes)

**Value range:** See chapter 5.2

**Note!**

Once you have set the country identifier, the read/write head automatically resets all other parameters to their respective default values. When programming or configuring parameters manually, always set the correct country identifier before changing any other parameters.

**Note!**

The country identifier remains unchanged when the default status is restored.

**Note!**

The IUH-F192-V1-FR2-02 is supplied ex-works with the country identifier "02" for the USA, Canada, and Mexico. Due to legal regulations, you cannot change this country identifier in the IUH-F192-V1-FR2-02.

Example:
WP1URC.00.02.00.03 sets the country identifier to China.

RP1URC.00.00 reads out the country identifier set.

The serial response .30.31.00.01 indicates the country identifier for Europe, which you can modify.

The serial response .30.31.80.02 indicates the country identifier for the IUH-F192-V1-FR2-02, which is set by the manufacturer. You cannot change this country identifier.

**Reset to Default, RD**

This parameter returns all settings of the read/write head to the default configuration.

### ParamTyp: RD

</tbody>
</table>

Transmission Pauses in "Sensing Mode" SM

The parameter SM defines a pause time in milliseconds. This pause time is executed once all runs are complete.

This parameter is especially useful for continuous operation with "enhanced" commands (see chapter 6.4). If you specify transmission pauses, you can operate the read/write head at higher ambient temperatures.

ParamTyp: SM
Default: SM = 100 ms
SM = 0 ms
Value range: 100 ms ... 65,535 ms, 2 bytes
0 ms ... 65,535 ms, 2 bytes

Example:
WP1USM.00.02.27.10 sets the pause time to 10,000 ms = 10 seconds.

1. For all FR1 read/write heads
2. For all FR2 read/write heads
3. For all FR1 read/write heads
4. For all FR2 read/write heads
RP1USM.00.00 reads out the pause time.

**Number of Attempts "Tries Allowed" TA**

This parameter sets the permitted number of read or write attempts, or reads out the permitted number of attempts.

- **ParamTyp:**  TA
- **Default:**  TA = 1
- **Value range:**  1 ... 255

Example:

WP1UTA.00.01.01 permits precisely one attempt (= no repeats)

WP1UTA.00.01.03 permits three attempts

RP1UTA.00.00 reads out the permitted number of attempts

If the permitted number of read or write attempts between the read/write head and the tag is increased, this results in:

- More reliable reading and writing.
- Increased response time.

### 6.7 Error/Status Messages

<table>
<thead>

</tr>
<tr>
<td>D</td>
<td>Reserved</td>
</tr>
<tr>
<td>E</td>
<td>Internal buffer overflow; execute reset.</td>
</tr>
<tr>
<td>F</td>
<td>Indicates the end of an output in the multiframe protocol (see &quot;Protocol Mode QV&quot; on page 60).</td>
</tr>
</tbody>
</table>
7 Service and Maintenance

The device is designed and constructed to function stable over long periods of time. For this reason, regular cleaning or maintenance is unnecessary.
## Troubleshooting

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
</table>
| Interference from several read/write heads in the direct vicinity | - Change the setting of the transmission channels  
- Reduce the transmission power |
| Status A message                                       | - Check whether there are multiple tags in the detection range:  
  Remove the tag from the detection range by placing the tag in a sealed metal container  
  Repeat the read or write operation  
- Use filter commands  
- Determine whether multiple tags have the same UII/EPC |
| Device not responding, green LED flashing              | - Set the correct country identifier. See chapter 5.2 and see chapter 3.3. |

9.3 Detection Range

The read/write head has a typical detection range of around 1 meter; this range is determined by the tag used and can be adjusted by selecting the transmission power. Other influencing factors include the setup and installation of the specific application, interference from any materials present (in particular metal), and the ambient conditions. The read and write distances for the relevant tag, which are detailed separately, have been established in a test laboratory under ideal conditions. For this reason, the combination of read/write head and tag must be tested for the intended application under real conditions.

Please note the distance tables. The distance tables and additional information regarding your product can be found at http://www.pepperl-fuchs.com. Simply enter the product name or model number in the Search box and then click the Search key.

Select your product from the list of search results. Click on the information you require in the product information list, e.g., Technical documents.

A list of all available documents is displayed.

Antenna Diagram

The antenna diagrams show the electric field strength in the far field depending on the direction. The front of the read/write head points towards 0°.
