Description of the sensor functions

The sensing range is determined in the downstream evaluation electronics (e. g. the units UH3-KHD2-4E5, or UH3-KHD2-4I).

The sensing range is determined on the basis of the echo time of a transmitted pulse in pulse-echo mode.

Temperature compensation

A temperature pulse is available at the temperature output for external temperature compensation. It is synchronous to the externally applied clock pulse and has the length T_{Temp} , calculated as follows:

$$T_{Temp}[\mu s] = T_{Takt}[\mu s] + T[K] \times 10\mu s/K$$

Put into the formula the temperature in Kelvin and the clock time in the unit μs .

- 1) The unusable area (blind range) BR depends on the pulse duration. The unusable area reaches a minimum with the shortest pulse duration.
- 2) The sensors detection range depends on the pulse duration. With pulse duration < typical pulse duration, the sensors detection range may be reduced.
