**230 V AC
KFA6-DU-Ex1.D**

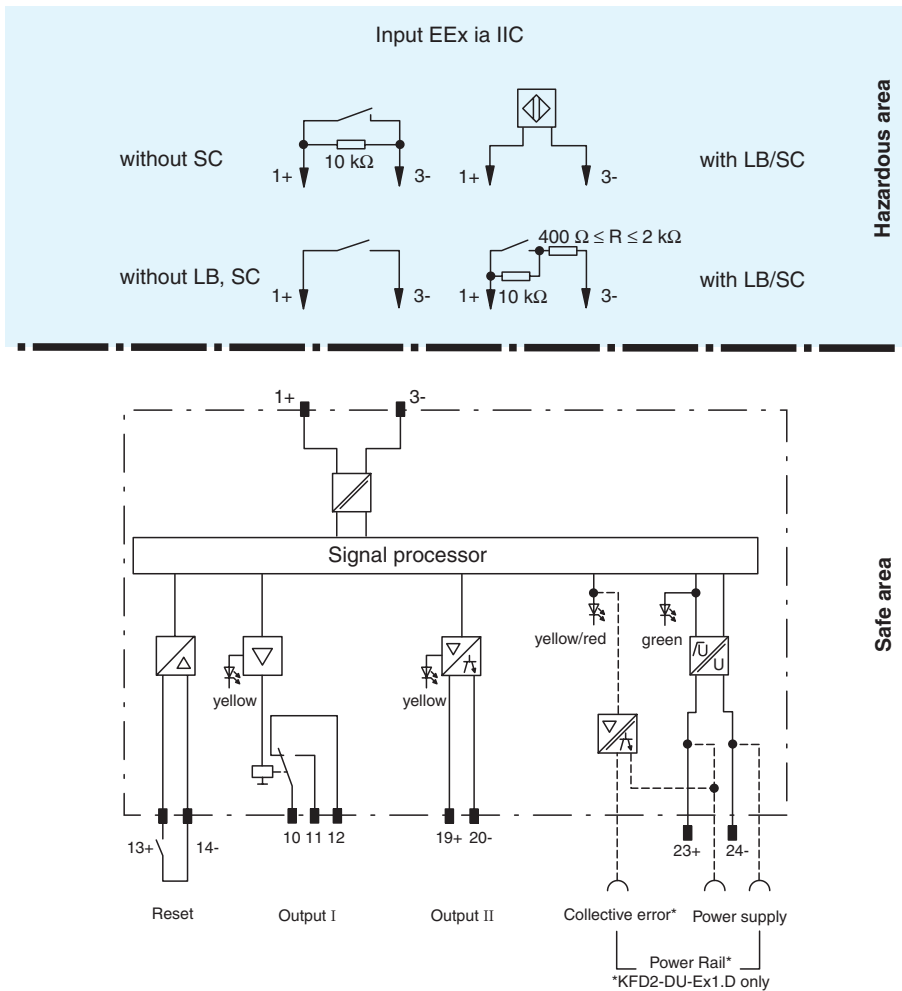

Function

The time relay offers the capability of switching input signals to outputs with a delay and extending the output signal. The switching duration is freely adjustable. In the case of rapid output signals, the relay can be turned off. A reset function that can be activated externally is used to terminate a time function once it has been started. The maximum input frequency is 80 Hz. Parameters can be entered using the control panel on the front of the device. By means of the pulse separator function integral or fractional step down ratios in a range of 1:1 to 9999:1 can be realized. When using the pulse separator function the max. input frequency is 1 kHz. The input and output circuits are separated galvanically. Power can be supplied to the KFD2-DU-Ex1.D through the Power Rail. The Power Rail also transfers the collective error message.

Range of application:

Extension of very short pulses to adjust to slow PLC inputs, for example, or to suppress very short input pulses, etc.
