

# Through-beam ultrasonic barrier UBE1000-18GM40A-SE2-V1

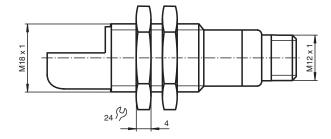

- Short design, 40 mm
- Function indicators visible from all directions
- Switching output
- Program input
- Integrated alignment aid

Single head system

# **Dimensions**

# **Technical Data**

General specifications		
Sensing range		15 1000 mm
Standard target plate		100 mm x 100 mm
Transducer frequency		approx. 255 kHz
Indicators/operating means		
LED green		Power on
LED yellow		switching state
LED red		error, object uncertain
Electrical specifications		
Operating voltage	$U_B$	10 30 V DC , ripple 10 %ss
No-load supply current	Io	≤ 20 mA
Time delay before availability	t <sub>v</sub>	≤ 200 ms
Input

Obstacle: flat plate 100 mm x 100 mm

### Obstacle size

**Additional Information** 

A through-beam ultrasonic barrier always consists of a single emitter and a single receiver. The function of a through-beam ultrasonic barrier is based in the interruption of the sound transmission to the receiver by the object to be detected.

The emitter sends an ultrasonic signal that is evaluated by the receiver. If the signal is interrupted or muted by the object to be detected, the receiver switches.

No electrical connections are required between the emitter and receiver.

The function of through-beam ultrasonic barriers is not dependent on the position of their installation. We recommend, however, to install the emitter below in the case of vertical installations to prevent the accumulation of dust particles.

#### Startup and parameterising

For easy alignment of emitter and receiver towards each other, the receiver is equipped with an alignment aid. To activate the alignment aid, the TEACH-Input of the receiver (pin 2) has to be connected to ground (-U<sub>B</sub>). The flashing frequency of the yellow LED indicates the strength of the received ultrasonic signal. The better the alignment, the stronger the signal.

LED yellow, flashing frequency	Description
slowly (appr. 1.5 Hz)	no signal
medium (appr. 3 Hz)	weak signal
fast (appr. 9 Hz)	strong signal

Simultaneously the ultrasonic barrier evaluates the signal strength of the unobstructed signal path and generates the optimal switching threshold. When disconnecting the TEACH-input from -UB, this threshold is stored non-volatile in the receivers memory. In case of clear ultrasonic path (no object), only the receivers green LED is on.

#### **TEACH-In of very small objects/obstacles**

Like shown in the curve "obstacle size", the ultrasonic barrier offers the possibility to detect very small objects at a distance of more than 300 mm.

- place the object to be detected in the desired distance inside the ultrasonic path
- connect TEACH-input of the receiver to +U<sub>B</sub> (yellow LED flashes slowly)
- disconnect TEACH-input

In case of successful TEACH-IN (object is detected reliable), the yellow LED is on and the taught detection threshold is stored non-volatile to the receivers memory.

In case of unsuccessful TEACH-IN (object too small or too porous for ultrasonic sound), the red LED flashes 5 times and the ultrasonic barrier continues normal operation with unmodified detection threshold value.

#### **Test function**

For test purpose, the ultrasonic emitter is equipped with a test input. In normal operation mode (test input not connected or connected to -U<sub>B</sub>), the green LED of the emitter is on. If the test input is connected to +U<sub>B</sub>, the ultrasonic emitter gets deactivated and its LED changes into red. Simultaneously the receiver switches and its yellow LED goes on.
